

Package ‘admiral’

September 29, 2022

Type Package

Title ADaM in R Asset Library

Version 0.8.2

Description A toolbox for programming Clinical Data Interchange Standards Consortium (CDISC) compliant Analysis Data Model (ADaM) datasets in R. ADaM datasets are a mandatory part of any New Drug or Biologics License Application submitted to the United States Food and Drug Administration (FDA). Analysis derivations are implemented in accordance with the “Analysis Data Model Implementation Guide” (CDISC Analysis Data Model Team, 2021, <<https://www.cdisc.org/standards/foundational/adam/adamig-v1-3-release-package>>).

Language en-US

License Apache License (>= 2)

URL <https://pharmaverse.github.io/admiral/>,
<https://github.com/pharmaverse/admiral>

Encoding UTF-8

LazyData true

RoxygenNote 7.2.0

Depends R (>= 3.5)

Imports admiraldev, assertthat (>= 0.2.1), dplyr (>= 0.8.4), hms (>= 0.5.3), lifecycle (>= 0.1.0), lubridate (>= 1.7.4), magrittr (>= 1.5), purrr (>= 0.3.3), rlang (>= 0.4.4), stringr (>= 1.4.0), tidyr (>= 1.0.2), tidyselect (>= 1.0.0)

Suggests admiral.test, covr, devtools, DT, diffdf, knitr, lintr, methods, pkgdown, readxl, rmarkdown, roxygen2, spelling, styler, testthat, tibble, usethis

admiral_adsl *Subject Level Analysis Dataset*

Description

An example subject level analysis dataset

Usage

```
admiral_adsl
```

Format

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 306 rows and 50 columns.

Source

Derived from the `dm` and `ds` datasets using `{admiral}` (https://github.com/pharmaverse/admiral/blob/main/inst/templates/ad_adsl.R)

See Also

Other datasets: [atoxgr_criteria_ctcv4](#), [ex_single](#), [queries_mh](#), [queries](#)

assert_db_requirements

Check required parameters for SMQ/SDG

Description

If SMQs or SDGs are requested, the version and a function to access the database must be provided. The function checks these requirements.

Usage

```
assert_db_requirements(
  version,
  version_arg_name,
  fun,
  fun_arg_name,
  queries,
  i,
  type
)
```

Arguments

| | |
|------------------|---|
| version | Version provided by user |
| version_arg_name | Name of the argument providing the version |
| fun | Function provided by user |
| fun_arg_name | Name of the argument providing the function |
| queries | Queries provide by user |
| i | Index of query being checked |
| type | Type of query Should be "SMQ" or "SDG". |

Value

An error is issued if version or fun is null.

Author(s)

Stefan Bundfuss

assert_terms

Asserts Requirements for Terms for Queries

Description

The function checks the requirements for terms for queries provided by the user. The terms could have been provided directly in the query definition or via a user provided function for accessing a SMQ or SDG database.

Usage

```
assert_terms(
  terms,
  expect_query_name = FALSE,
  expect_query_id = FALSE,
  source_text
)
```

Arguments

| | |
|-------------------|--|
| terms | Terms provided by user |
| expect_query_name | Is the QUERY_NAME column expected? |
| expect_query_id | Is the QUERY_ID column expected? |
| source_text | Text describing the source of the terms, e.g., "the data frame provided for the definition element". |

Value

An error is issued if

- terms is not a data frame,
- terms has zero observations,
- the TERM_LEVEL variable is not in terms,
- neither the TERM_NAME nor the TERM_ID variable is in terms,
- expect_query_name == TRUE and the QUERY_NAME variable is not in terms,
- expect_query_id == TRUE and the QUERY_ID variable is not in terms,

Author(s)

Stefan Bundfuss

Source Specifications: [assert_db_requirements\(\)](#), [assert_valid_queries\(\)](#), [censor_source\(\)](#), [date_source\(\)](#), [death_event](#), [derive_var_dthcaus\(\)](#), [event_source\(\)](#), [extend_source_datasets\(\)](#), [filter_date_sources\(\)](#), [format.sdg_select\(\)](#), [format.smq_select\(\)](#), [list_tte_source_objects\(\)](#), [params\(\)](#), [query\(\)](#), [sdg_select\(\)](#), [smq_select\(\)](#), [tte_source\(\)](#), [validate_query\(\)](#), [validate_sdg_select\(\)](#), [validate_smq_select\(\)](#)

Examples

```
try(  
  assert_terms(  
    terms = 42,  
    source_text = "object provided by the `definition` element"  
  )  
)
```

assert_valid_queries *Verify if a Dataset Has the Required Format as Queries Dataset.*

Description

Verify if a Dataset Has the Required Format as Queries Dataset.

Usage

```
assert_valid_queries(queries, queries_name)
```

Arguments

queries A data.frame.
queries_name Name of the queries dataset, a string.

Details

Check if the dataset has the following columns

- VAR_PREFIX, e.g., SMQ01, CQ12
- QUERY_NAME, non NA, must be unique per each VAR_PREFIX
- QUERY_ID, could be NA, must be unique per each VAR_PREFIX
- QUERY_SCOPE, 'BROAD', 'NARROW', or NA
- QUERY_SCOPE_NUM, 1, 2, or NA
- TERM_LEVEL, e.g., "AEDECOD", "AELLT", "AELLTCD", ...
- TERM_NAME, character, could be NA only at those observations where TERM_ID is non-NA
- TERM_ID, integer, could be NA only at those observations where TERM_NAME is non-NA

Value

The function throws an error if any of the requirements not met.

atoxgr_criteria_ctcv4 *Metadata Holding Grading Criteria for NCI-CTCAEv4*

Description

Metadata Holding Grading Criteria for NCI-CTCAEv4

Usage

```
atoxgr_criteria_ctcv4
```

Format

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 40 rows and 13 columns.

Details

This metadata has its origin in the ADLB Grading Spec Excel file which ships with {admiral} and can be accessed using `system.file("adlb_grading/adlb_grading_spec.xlsx", package = "admiral")`. The dataset contained in there has the following columns:

- SOC: variable to hold the SOC of the lab test criteria.
- TERM: variable to hold the term describing the criteria applied to a particular lab test, eg. 'Anemia' or 'INR Increased'. Note: the variable is case insensitive.
- Grade 1: Criteria defining lab value as Grade 1.
- Grade 2: Criteria defining lab value as Grade 2.
- Grade 3: Criteria defining lab value as Grade 3.
- Grade 4: Criteria defining lab value as Grade 4.
- Grade 5: Criteria defining lab value as Grade 5.
- Definition: Holds the definition of the lab test abnormality.
- GRADE_CRITERIA_CODE: variable to hold code that creates grade based on defined criteria.
- SI_UNIT_CHECK: variable to hold unit of particular lab test. Used to check against input data if criteria is based on absolute values.
- VAR_CHECK: List of variables required to implement lab grade criteria. Use to check against input data.
- DIRECTION: variable to hold the direction of the abnormality of a particular lab test value. 'L' is for LOW values, 'H' is for HIGH values. Note: the variable is case insensitive.
- COMMENT: Holds any information regarding rationale behind implementation of grading criteria.

Note: Variables SOC, TERM, Grade 1, Grade 2, Grade 3, Grade 4, Grade 5, Definition are from the source document on NCI-CTC website defining the grading criteria. From these variables only 'TERM' is used in the admiral code, the rest are for information and tracability only.

call_derivation *Call a Single Derivation Multiple Times*

Description

Call a single derivation multiple times with some parameters/arguments being fixed across iterations and others varying.

Usage

```
call_derivation(dataset = NULL, derivation, variable_params, ...)
```

Arguments

| | |
|-----------------|---|
| dataset | The input dataset |
| derivation | The derivation function to call |
| variable_params | A list of function arguments that are different across iterations. Each set of function arguments must be created using params() . |
| ... | Any number of <i>named</i> function arguments that stay the same across iterations. If a function argument is specified both inside <code>variable_params</code> and <code>...</code> then the value in <code>variable_params</code> overwrites the one in <code>...</code> |

Value

The input dataset with additional records/variables added depending on which derivation has been used.

Author(s)

Thomas Neitmann, Stefan Bundfuss, Tracey Wang

Higher Order Functions: [derivation_slice\(\)](#), [print.derivation_slice\(\)](#), [restrict_derivation\(\)](#), [slice_derivation\(\)](#)

Examples

```

library(dplyr, warn.conflicts = FALSE)
library(admiral.test)
data(admiral_ae)
data(admiral_adsl)

adae <-
  select(admiral_ae[sample(1:nrow(admiral_ae), 1000), ], USUBJID, AESTDTC, AEENDTC) %>%
  derive_vars_merged(
    dataset_add = admiral_adsl,
    new_vars = vars(TRTSDT, TRTEDT),
    by_vars = vars(USUBJID)
  )

## While `derive_vars_dt()` can only add one variable at a time, using `call_derivation()`
## one can add multiple variables in one go
call_derivation(
  dataset = adae,
  derivation = derive_vars_dt,
  variable_params = list(
    params(dtc = AESTDTC, date_imputation = "first", new_vars_prefix = "AST"),
    params(dtc = AEENDTC, date_imputation = "last", new_vars_prefix = "AEN")
  ),
  min_dates = vars(TRTSDT),
  max_dates = vars(TRTEDT)
)

## The above call using `call_derivation()` is equivalent to the following
adae %>%
  derive_vars_dt(
    new_vars_prefix = "AST",
    dtc = AESTDTC,
    date_imputation = "first",
    min_dates = vars(TRTSDT),
    max_dates = vars(TRTEDT)
  ) %>%
  derive_vars_dt(
    new_vars_prefix = "AEN",
    dtc = AEENDTC,
    date_imputation = "last",
    min_dates = vars(TRTSDT),
    max_dates = vars(TRTEDT)
  )

```

call_user_fun

Calls a Function Provided by the User

Description

Calls a function provided by the user and adds the function call to the error message if the call fails.

Usage

```
call_user_fun(call)
```

Arguments

```
call          Call to be executed
```

Value

The return value of the function call

Author(s)

Stefan Bundfuss

See Also

Utilities used within Derivation functions: [extract_unit\(\)](#), [get_not_mapped\(\)](#), [signal_duplicate_records\(\)](#)

Examples

```
call_user_fun(compute_bmi(  
  height = 172,  
  weight = 60  
))  
  
try(call_user_fun(compute_bmi(  
  height = 172,  
  weight = "hallo"  
)))
```

censor_source *Create a censor_source Object*

Description

censor_source objects are used to define censorings as input for the `derive_param_tte()` function.

Usage

```
censor_source(  
  dataset_name,  
  filter = NULL,  
  date,  
  censor = 1,  
  set_values_to = NULL  
)
```

Arguments

| | |
|---------------|--|
| dataset_name | The name of the source dataset The name refers to the dataset provided by the source_datasets parameter of derive_param_tte(). |
| filter | An unquoted condition for selecting the observations from dataset which are events or possible censoring time points. |
| date | A variable providing the date of the event or censoring. A date, or a datetime can be specified. An unquoted symbol is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. |
| censor | Censoring value CDISC strongly recommends using 0 for events and positive integers for censoring. |
| set_values_to | A named list returned by vars() defining the variables to be set for the event or censoring, e.g. vars(EVENTDESC = "DEATH", SRCDOM = "ADSL", SRCVAR = "DTHDT"). The values must be a symbol, a character string, a numeric value, or NA. |

Value

An object of class censor_source, inheriting from class tte_source

Author(s)

Stefan Bundfuss

censor_source(
  dataset_name = "adsl",
  date = LSTALVDT,
  set_values_to = vars(
    EVNTDESC = "ALIVE",
    SRCDOM = "ADSL",
    SRCVAR = "LSTALVDT"
  )
)
```

| | |
|-------------|--------------------------------------|
| compute_bmi | <i>Compute Body Mass Index (BMI)</i> |
|-------------|--------------------------------------|

Description

Computes BMI from height and weight

Usage

```
compute_bmi(height, weight)
```

Arguments

| | |
|--------|--|
| height | HEIGHT value It is expected that HEIGHT is in cm. Permitted Values: numeric vector |
| weight | WEIGHT value It is expected that WEIGHT is in kg. Permitted Values: numeric vector |

Details

Usually this computation function can not be used with %>%.

Value

The BMI (Body Mass Index Area) in kg/m².

Author(s)

Pavan Kumar

```

| | |
|-------------|--|
| compute_bsa | <i>Compute Body Surface Area (BSA)</i> |
|-------------|--|

Description

Computes BSA from height and weight making use of the specified derivation method

Usage

```
compute_bsa(height = height, weight = weight, method)
```

Arguments

| | |
|--------|---|
| height | HEIGHT value It is expected that HEIGHT is in cm. Permitted Values: numeric vector |
| weight | WEIGHT value It is expected that WEIGHT is in kg. Permitted Values: numeric vector |
| method | Derivation method to use: Mosteller: $\sqrt{\text{height} * \text{weight} / 3600}$ DuBois-DuBois: $0.20247 * (\text{height}/100) ^ 0.725 * \text{weight} ^ 0.425$ Haycock: $0.024265 * \text{height} ^ 0.3964 * \text{weight} ^ 0.5378$ Gehan-George: $0.0235 * \text{height} ^ 0.42246 * \text{weight} ^ 0.51456$ Boyd: $0.0003207 * (\text{height} ^ 0.3) * (1000 * \text{weight}) ^ (0.7285 - (0.0188 * \log_{10}(1000 * \text{weight})))$ Fujimoto: $0.008883 * \text{height} ^ 0.663 * \text{weight} ^ 0.444$ Takahira: $0.007241 * \text{height} ^ 0.725 * \text{weight} ^ 0.425$ Permitted Values: character value |

Details

Usually this computation function can not be used with %>%.

Value

The BSA (Body Surface Area) in m².

| | |
|-------------|--|
| compute_dtf | <i>Derive the Date Imputation Flag</i> |
|-------------|--|

Description

Derive the date imputation flag ('--DTF') comparing a date character vector ('--DTC') with a Date vector ('--DT').

Usage

```
compute_dtf(dtc, dt)
```

Arguments

| | |
|-----|--|
| dtc | The date character vector ('--DTC'). A character date is expected in a format like yyyy-mm-ddThh:mm:ss (partial or complete). |
| dt | The Date vector to compare. A date object is expected. |

Details

Usually this computation function can not be used with %>%.

Value

The date imputation flag ('--DTF') (character value of 'D', 'M', 'Y' or NA)

Author(s)

Samia Kabi

Date/Time Computation Functions that returns a vector: [compute_duration\(\)](#), [compute_tmf\(\)](#), [convert_date_to_dtm\(\)](#), [convert_dtc_to_dtm\(\)](#), [convert_dtc_to_dt\(\)](#), [impute_dtc_dtm\(\)](#), [impute_dtc_dt\(\)](#)

Examples

```
compute_dtf(dtc = "2019-07", dt = as.Date("2019-07-18"))
compute_dtf(dtc = "2019", dt = as.Date("2019-07-18"))
```

| | |
|------------------|-------------------------|
| compute_duration | <i>Compute Duration</i> |
|------------------|-------------------------|

Description

Compute duration between two dates, e.g., duration of an adverse event, relative day, age, ...

Usage

```
compute_duration(
  start_date,
  end_date,
  in_unit = "days",
  out_unit = "days",
  floor_in = TRUE,
  add_one = TRUE,
  trunc_out = FALSE
)
```

Arguments

| | |
|------------|--|
| start_date | The start date A date or date-time object is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. Refer to convert_dtc_to_dt() to obtain a vector of imputed dates. |
| end_date | The end date A date or date-time object is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. Refer to convert_dtc_to_dt() to obtain a vector of imputed dates. |
| in_unit | Input unit See floor_in and add_one parameter for details. Default: 'days' Permitted Values: 'years', 'months', 'days', 'hours', 'minutes', 'seconds' |

| | |
|-----------|---|
| out_unit | <p>Output unit</p> <p>The duration is derived in the specified unit</p> <p>Default: 'days'</p> <p>Permitted Values: 'years', 'months', 'weeks', 'days', 'hours', 'minutes', 'seconds'</p> |
| floor_in | <p>Round down input dates?</p> <p>The input dates are round down with respect to the input unit, e.g., if the input unit is 'days', the time of the input dates is ignored.</p> <p>Default: 'TRUE'</p> <p>Permitted Values: TRUE, FALSE</p> |
| add_one | <p>Add one input unit?</p> <p>If the duration is non-negative, one input unit is added. i.e., the duration can not be zero.</p> <p>Default: TRUE</p> <p>Permitted Values: TRUE, FALSE</p> |
| trunc_out | <p>Return integer part</p> <p>The fractional part of the duration (in output unit) is removed, i.e., the integer part is returned.</p> <p>Default: FALSE</p> <p>Permitted Values: TRUE, FALSE</p> |

Details

The output is a numeric vector providing the duration as time from start to end date in the specified unit. If the end date is before the start date, the duration is negative.

Value

The duration between the two date in the specified unit

Author(s)

Stefan Bundfuss

  trunc_out = TRUE,
  out_unit = "years",
  add_one = FALSE
)

# Derive duration in hours
compute_duration(
  start_date = lubridate::ymd_hms("2020-12-06T9:00:00"),
  end_date = lubridate::ymd_hms("2020-12-06T13:30:00"),
  out_unit = "hours",
  floor_in = FALSE,
  add_one = FALSE,
)

```

compute_framingham *Compute Framingham Heart Study Cardiovascular Disease 10-Year Risk Score*

Description

Computes Framingham Heart Study Cardiovascular Disease 10-Year Risk Score (FCVD101) based on systolic blood pressure, total serum cholesterol (mg/dL), HDL serum cholesterol (mg/dL), sex, smoking status, diabetic status, and treated for hypertension flag.

Usage

```
compute_framingham(sysbp, chol, cholhdl, age, sex, smokefl, diabetfl, trthypfl)
```

Arguments

| | |
|---------|--|
| sysbp | Systolic blood pressure A numeric vector is expected. |
| chol | Total serum cholesterol (mg/dL) A numeric vector is expected. |
| cholhdl | HDL serum cholesterol (mg/dL) A numeric vector is expected. |

| | |
|----------|---|
| age | Age (years) A numeric vector is expected. |
| sex | Gender A character vector is expected. Expected Values: 'M' 'F' |
| smokefl | Smoking Status A character vector is expected. Expected Values: 'Y' 'N' |
| diabetfl | Diabetic Status A character vector is expected. Expected Values: 'Y' 'N' |
| trthypfl | Treated for hypertension status A character vector is expected. Expected Values: 'Y' 'N' |

Details

The predicted probability of having cardiovascular disease (CVD) within 10-years according to Framingham formula [D'Agostino, 2008](#) is: # nolint

For Women:

| Factor | Amount |
|----------------------------|----------|
| Age | 2.32888 |
| Total Chol | 1.20904 |
| HDL Chol | -0.70833 |
| Sys BP | 2.76157 |
| Sys BP + Hypertension Meds | 2.82263 |
| Smoker | 0.52873 |
| Non-Smoker | 0 |
| Diabetic | 0.69154 |
| Not Diabetic | 0 |
| Average Risk | 26.1931 |
| Risk Period | 0.95012 |

For Men:

| Factor | Amount |
|----------------------------|----------|
| Age | 3.06117 |
| Total Chol | 1.12370 |
| HDL Chol | -0.93263 |
| Sys BP | 1.93303 |
| Sys BP + Hypertension Meds | 2.99881 |
| Smoker | .65451 |
| Non-Smoker | 0 |
| Diabetic | 0.57367 |
| Not Diabetic | 0 |
| Average Risk | 23.9802 |
| Risk Period | 0.88936 |

The equation for calculating risk:

$$RiskFactors = (\log(Age)*AgeFactor) + (\log(TotalChol)*TotalCholFactor) + (\log(CholHDL)*CholHDLFactor)$$

$$Risk = 100 * (1 - RiskPeriodFactor^{exp(RiskFactors)})$$

Value

A numeric vector of Framingham values

Author(s)

Alice Ehmann

)
```

compute_map

Compute Mean Arterial Pressure (MAP)

Description

Computes mean arterial pressure (MAP) based on diastolic and systolic blood pressure. Optionally heart rate can be used as well.

Usage

```
compute_map(diabp, sysbp, hr = NULL)
```

Arguments

| | |
|-------|---|
| diabp | Diastolic blood pressure A numeric vector is expected. |
| sysbp | Systolic blood pressure A numeric vector is expected. |
| hr | Heart rate A numeric vector or NULL is expected. |

Details

$$\frac{2DIABP + SYSBP}{3}$$

if it is based on diastolic and systolic blood pressure and

$$DIABP + 0.01e^{4.14 - \frac{40.74}{HR}} (SYSBP - DIABP)$$

if it is based on diastolic, systolic blood pressure, and heart rate.

Usually this computation function can not be used with %>%.

Value

A numeric vector of MAP values

Author(s)

Stefan Bundfuss

# Compute MAP based on diastolic and systolic blood pressure
compute_map(diabp = 51, sysbp = 121)
```

```
# Compute MAP based on diastolic and systolic blood pressure and heart rate
compute_map(diabp = 51, sysbp = 121, hr = 59)
```

 compute_qtc

Compute Corrected QT

Description

Computes corrected QT using Bazett's, Fridericia's or Sagie's formula.

Usage

```
compute_qtc(qt, rr, method)
```

Arguments

| | |
|--------|--|
| qt | QT interval A numeric vector is expected. It is expected that QT is measured in msec. |
| rr | RR interval A numeric vector is expected. It is expected that RR is measured in msec. |
| method | Method used to QT correction Permitted Values: "Bazett", "Fridericia", "Sagie" |

Details

Depending on the chosen method one of the following formulae is used.

Bazett:

$$\frac{QT}{\sqrt{\frac{RR}{1000}}}$$

Fridericia:

$$\frac{QT}{\sqrt[3]{\frac{RR}{1000}}}$$

Sagie:

$$1000 \left(\frac{QT}{1000} + 0.154 \left(1 - \frac{RR}{1000} \right) \right)$$

Usually this computation function can not be used with %>%.

Value

QT interval in msec

Author(s)

Stefan Bundfuss

```
compute_qual_imputation
```

Function to Impute Values When Qualifier Exists in Character Result

Description

Derive an imputed value

Usage

```
compute_qual_imputation(character_value, imputation_type = 1, factor = 0)
```

Arguments

character_value

Character version of value to be imputed

imputation_type

(default value=1) Valid Values: 1: Strip <, >, = and convert to numeric. 2: imputation_type=1 and if the character value contains a < or >, the number of of decimals associated with the character value is found and then a factor of $1/10^{(\text{number of decimals} + 1)}$ will be added/subtracted from the numeric value. If no decimals exists, a factor of $1/10$ will be added/subtracted from the value.

factor

Numeric value (default=0), when using imputation_type = 1, this value can be added or subtracted when the qualifier is removed.

Value

The imputed value

Author(s)

Alice Ehmann Ojesh Upadhyay

Examples

```
compute_qual_imputation("<40")
```

```
compute_qual_imputation_dec
```

Compute Factor for Value Imputations When Character Value Contains < or >

Description

Function to compute factor for value imputation when character value contains < or >. The factor is calculated using the number of decimals. If there are no decimals, the factor is 1, otherwise the factor = $1/10^{\text{decimal place}}$. For example, the factor for 100 = 1, the factor for 5.4 = $1/10^1$, the factor for 5.44 = $1/10^2$. This results in no additional false precision added to the value. This is an intermediate function.

Usage

```
compute_qual_imputation_dec(character_value_decimal)
```

Arguments

```
character_value_decimal  
Character value to determine decimal precision
```

Details

Derive an imputed value

Value

Decimal precision value to add or subtract

Author(s)

Alice Ehmann Ojesh Upadhyay

compute_qual_imputation_dec("<40.1")
```

`compute_rr`*Compute RR Interval From Heart Rate*

Description

Computes RR interval from heart rate.

Usage

```
compute_rr(hr)
```

Arguments

`hr` Heart rate
A numeric vector is expected. It is expected that heart rate is measured in beats/min.

Details

Usually this computation function can not be used with %>%.

Value

RR interval in msec:

$$\frac{60000}{HR}$$

Author(s)

Stefan Bundfuss

See Also

BDS-Findings Functions that returns a vector: [compute_bmi\(\)](#), [compute_bsa\(\)](#), [compute_framingham\(\)](#), [compute_map\(\)](#), [compute_qtc\(\)](#), [compute_qual_imputation_dec\(\)](#), [compute_qual_imputation\(\)](#)

Examples

```
compute_rr(hr = 70.14)
```

 compute_tmf

Derive the Time Imputation Flag

Description

Derive the time imputation flag ('--TMF') comparing a date character vector ('--DTC') with a Datetime vector ('--DTM').

Usage

```
compute_tmf(dtc, dtm, ignore_seconds_flag = FALSE)
```

Arguments

| | |
|---------------------|--|
| dtc | The date character vector ('--DTC'). A character date is expected in a format like yyyy-mm-ddThh:mm:ss (partial or complete). |
| dtm | The Date vector to compare ('--DTM'). A datetime object is expected. |
| ignore_seconds_flag | ADaM IG states that given SDTM ('--DTC') variable, if only hours and minutes are ever collected, and seconds are imputed in ('--DTM') as 00, then it is not necessary to set ('--TMF') to 'S'. A user can set this to TRUE so the 'S' Flag is dropped from ('--TMF'). A logical value Default: FALSE |

Details

Usually this computation function can not be used with %>%.

Value

The time imputation flag ('--TMF') (character value of 'H', 'M', 'S' or NA)

Author(s)

Samia Kabi, Stefan Bundfuss

See Also

Date/Time Computation Functions that returns a vector: [compute_dtf\(\)](#), [compute_duration\(\)](#), [convert_date_to_dtm\(\)](#), [convert_dtc_to_dtm\(\)](#), [convert_dtc_to_dt\(\)](#), [impute_dtc_dtm\(\)](#), [impute_dtc_dt\(\)](#)

Examples

```
compute_tmf(dtc = "2019-07-18T15:25", dtm = as.POSIXct("2019-07-18T15:25:00"))
compute_tmf(dtc = "2019-07-18T15", dtm = as.POSIXct("2019-07-18T15:25:00"))
compute_tmf(dtc = "2019-07-18", dtm = as.POSIXct("2019-07-18"))
```

convert_blanks_to_na *Convert Blank Strings Into NAs*

Description

Turn SAS blank strings into proper R NAs.

Usage

```
convert_blanks_to_na(x)

## Default S3 method:
convert_blanks_to_na(x)

## S3 method for class 'character'
convert_blanks_to_na(x)

## S3 method for class 'list'
convert_blanks_to_na(x)

## S3 method for class 'data.frame'
convert_blanks_to_na(x)
```

Arguments

x Any R object

Details

The default methods simply returns its input unchanged. The character method turns every instance of "" into NA_character_ while preserving *all* attributes. When given a data frame as input the function keeps all non-character columns as is and applies the just described logic to character columns. Once again all attributes such as labels are preserved.

Value

An object of the same class as the input

Author(s)

Thomas Neitmann

See Also

Utilities for Formatting Observations: [format_eoxxstt_default\(\)](#), [format_reason_default\(\)](#), [yn_to_numeric\(\)](#)

Examples

```
convert_blanks_to_na(c("a", "b", "", "d", ""))

df <- tibble::tibble(
  a = structure(c("a", "b", "", "c"), label = "A"),
  b = structure(c(1, NA, 21, 9), label = "B"),
  c = structure(c(TRUE, FALSE, TRUE, TRUE), label = "C"),
  d = structure(c("", "", "s", "q"), label = "D")
)
print(df)
convert_blanks_to_na(df)
```

convert_date_to_dtm *Convert a Date into a Datetime Object*

Description

Convert a date (datetime, date, or date character) into a Date vector (usually '--DTM').

Usage

```
convert_date_to_dtm(
  dt,
  highest_imputation = "h",
  date_imputation = "first",
  time_imputation = "first",
  min_dates = NULL,
  max_dates = NULL,
  preserve = FALSE
)
```

Arguments

dt The date to convert.
A date or character date is expected in a format like yyyy-mm-ddThh:mm:ss.

highest_imputation Highest imputation level
The `highest_imputation` argument controls which components of the DTC value are imputed if they are missing. All components up to the specified level are imputed.
If a component at a higher level than the highest imputation level is missing, `NA_character_` is returned. For example, for `highest_imputation = "D"` `"2020"` results in `NA_character_` because the month is missing.

If "n" is specified, no imputation is performed, i.e., if any component is missing, NA_character_ is returned.

If "Y" is specified, date_imputation should be "first" or "last" and min_dates or max_dates should be specified respectively. Otherwise, NA_character_ is returned if the year component is missing.

Default: "h"

Permitted Values: "Y" (year, highest level), "M" (month), "D" (day), "h" (hour), "m" (minute), "s" (second), "n" (none, lowest level)

date_imputation

The value to impute the day/month when a datepart is missing.

A character value is expected, either as a

- format with month and day specified as "mm-dd": e.g. "06-15" for the 15th of June (The year can not be specified; for imputing the year "first" or "last" together with min_dates or max_dates argument can be used (see examples).),
- or as a keyword: "first", "mid", "last" to impute to the first/mid/last day/month.

The argument is ignored if highest_imputation is less than "D".

Default: "first".

time_imputation

The value to impute the time when a timepart is missing.

A character value is expected, either as a

- format with hour, min and sec specified as "hh:mm:ss": e.g. "00:00:00" for the start of the day,
- or as a keyword: "first", "last" to impute to the start/end of a day.

The argument is ignored if highest_imputation = "n".

Default: "first".

min_dates

Minimum dates

A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example

```
impute_dtc_dtm(
  "2020-11",
  min_dates = list(
    ymd_hms("2020-12-06T12:12:12"),
    ymd_hms("2020-11-11T11:11:11")
  ),
  highest_imputation = "M"
)
```

returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12"

is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).

For date variables (not datetime) in the list the time is imputed to "00:00:00". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.

| | |
|-----------|--|
| max_dates | <p>Maximum dates</p> <p>A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.</p> <p>For date variables (not datetime) in the list the time is imputed to "23:59:59". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.</p> |
| preserve | <p>Preserve day if month is missing and day is present</p> <p>For example "2019---07" would return "2019-06-07 if preserve = TRUE (and date_imputation = "mid").</p> <p>Permitted Values: TRUE, FALSE</p> <p><i>Default:</i> FALSE</p> |

Details

Usually this computation function can not be used with %>%.

Value

A datetime object

Author(s)

Samia Kabi

See Also

Date/Time Computation Functions that returns a vector: [compute_dtf\(\)](#), [compute_duration\(\)](#), [compute_tmf\(\)](#), [convert_dtc_to_dtm\(\)](#), [convert_dtc_to_dt\(\)](#), [impute_dtc_dtm\(\)](#), [impute_dtc_dt\(\)](#)

Examples

```
convert_date_to_dtm("2019-07-18T15:25:00")
convert_date_to_dtm(Sys.time())
convert_date_to_dtm(as.Date("2019-07-18"), time_imputation = "23:59:59")
convert_date_to_dtm("2019-07-18", time_imputation = "23:59:59")
convert_date_to_dtm("2019-07-18")
```

convert_dtc_to_dt *Convert a Date Character Vector into a Date Object*

Description

Convert a date character vector (usually '-DTC') into a Date vector (usually '-DT').

Usage

```
convert_dtc_to_dt(
  dtc,
  highest_imputation = "n",
  date_imputation = "first",
  min_dates = NULL,
  max_dates = NULL,
  preserve = FALSE
)
```

Arguments

dtc The -DTC date to convert.

highest_imputation Highest imputation level
 The `highest_imputation` argument controls which components of the DTC value are imputed if they are missing. All components up to the specified level are imputed.
 If a component at a higher level than the highest imputation level is missing, `NA_character_` is returned. For example, for `highest_imputation = "D"` `"2020"` results in `NA_character_` because the month is missing.
 If `"n"` is specified no imputation is performed, i.e., if any component is missing, `NA_character_` is returned.
 If `"Y"` is specified, `date_imputation` should be `"first"` or `"last"` and `min_dates` or `max_dates` should be specified respectively. Otherwise, `NA_character_` is returned if the year component is missing.
Default: `"n"`
Permitted Values: `"Y"` (year, highest level), `"M"` (month), `"D"` (day), `"n"` (none, lowest level)

date_imputation The value to impute the day/month when a datepart is missing.
 A character value is expected, either as a

- format with month and day specified as `"mm-dd"`: e.g. `"06-15"` for the 15th of June (The year can not be specified; for imputing the year `"first"` or `"last"` together with `min_dates` or `max_dates` argument can be used (see examples).),
- or as a keyword: `"first"`, `"mid"`, `"last"` to impute to the first/mid/last day/month.

The argument is ignored if highest_imputation is less than "D".

Default: "first"

min_dates

Minimum dates

A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example

```
impute_dtc_dtm(
  "2020-11",
  min_dates = list(
    ymd_hms("2020-12-06T12:12:12"),
    ymd_hms("2020-11-11T11:11:11")
  ),
  highest_imputation = "M"
)
```

returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12" is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).

max_dates

Maximum dates

A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.

preserve

Preserve day if month is missing and day is present

For example "2019--07" would return "2019-06-07" if preserve = TRUE (and date_imputation = "MID").

Permitted Values: TRUE, FALSE

Default: FALSE

Details

Usually this computation function can not be used with %>%.

Value

a date object

Author(s)

Samia Kabi

See Also

Date/Time Computation Functions that returns a vector: [compute_dtf\(\)](#), [compute_duration\(\)](#), [compute_tmf\(\)](#), [convert_date_to_dtm\(\)](#), [convert_dtc_to_dtm\(\)](#), [impute_dtc_dtm\(\)](#), [impute_dtc_dt\(\)](#)

Examples

```
convert_dtc_to_dt("2019-07-18")
convert_dtc_to_dt("2019-07")
```

convert_dtc_to_dtm *Convert a Date Character Vector into a Datetime Object*

Description

Convert a date character vector (usually '--DTC') into a Date vector (usually '--DTM').

Usage

```
convert_dtc_to_dtm(
  dtc,
  highest_imputation = "h",
  date_imputation = "first",
  time_imputation = "first",
  min_dates = NULL,
  max_dates = NULL,
  preserve = FALSE
)
```

Arguments

`dtc` The '--DTC' date to convert.

`highest_imputation`

Highest imputation level

The `highest_imputation` argument controls which components of the DTC value are imputed if they are missing. All components up to the specified level are imputed.

If a component at a higher level than the highest imputation level is missing, `NA_character_` is returned. For example, for `highest_imputation = "D"` `"2020"` results in `NA_character_` because the month is missing.

If `"n"` is specified, no imputation is performed, i.e., if any component is missing, `NA_character_` is returned.

If `"Y"` is specified, `date_imputation` should be `"first"` or `"last"` and `min_dates` or `max_dates` should be specified respectively. Otherwise, `NA_character_` is returned if the year component is missing.

Default: `"h"`

Permitted Values: `"Y"` (year, highest level), `"M"` (month), `"D"` (day), `"h"` (hour), `"m"` (minute), `"s"` (second), `"n"` (none, lowest level)

`date_imputation`

The value to impute the day/month when a datepart is missing.

A character value is expected, either as a

- format with month and day specified as "mm-dd": e.g. "06-15" for the 15th of June (The year can not be specified; for imputing the year "first" or "last" together with min_dates or max_dates argument can be used (see examples).),
- or as a keyword: "first", "mid", "last" to impute to the first/mid/last day/month.

The argument is ignored if highest_imputation is less than "D".

Default: "first".

time_imputation

The value to impute the time when a timepart is missing.

A character value is expected, either as a

- format with hour, min and sec specified as "hh:mm:ss": e.g. "00:00:00" for the start of the day,
- or as a keyword: "first", "last" to impute to the start/end of a day.

The argument is ignored if highest_imputation = "n".

Default: "first".

min_dates

Minimum dates

A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example

```
impute_dtc_dtm(
  "2020-11",
  min_dates = list(
    ymd_hms("2020-12-06T12:12:12"),
    ymd_hms("2020-11-11T11:11:11")
  ),
  highest_imputation = "M"
)
```

returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12" is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).

For date variables (not datetime) in the list the time is imputed to "00:00:00". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.

max_dates

Maximum dates

A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.

For date variables (not datetime) in the list the time is imputed to "23:59:59". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.

preserve Preserve day if month is missing and day is present
 For example "2019--07" would return "2019-06-07" if preserve = TRUE (and date_imputation = "mid").
 Permitted Values: TRUE, FALSE
Default: FALSE

Details

Usually this computation function can not be used with %>%.

Value

A datetime object

| | |
|-------------------|--|
| create_query_data | <i>Creates a queries dataset as input dataset to the dataset_queries argument in derive_vars_query()</i> |
|-------------------|--|

Description

Creates a queries dataset as input dataset to the dataset_queries argument in the derive_vars_query() function as defined in the [Queries Dataset Documentation](#).

Usage

```
create_query_data(
  queries,
  meddra_version = NULL,
  whodd_version = NULL,
  get_smq_fun = NULL,
  get_sdg_fun = NULL
)
```

Arguments

| | |
|----------------|---|
| queries | List of queries A list of query() objects is expected. |
| meddra_version | MedDRA version The MedDRA version used for coding the terms in the AE dataset should be specified. If any of the queries is a SMQ or a customized query including a SMQ, the parameter needs to be specified. <i>Permitted Values:</i> A character string (the expected format is company-specific) |
| whodd_version | WHO Drug Dictionary version The version of the WHO Drug Dictionary used for coding the terms in the CM dataset should be specified. If any of the queries is a SDG, the parameter needs to be specified. <i>Permitted Values:</i> A character string (the expected format is company-specific) |
| get_smq_fun | Function which returns the terms of an SMQ For each query specified for the queries parameter which refers to an SMQ (i.e., those where the definition field is set to a smq_select() object or a list which contains at least one smq_select() object) the specified function is called to retrieve the terms defining the query. This function is not provided by admiral as it is company specific, i.e., it has to be implemented at company level. The function must return a dataset with all the terms defining the SMQ. The output dataset must contain the following variables. <ul style="list-style-type: none"> • TERM_LEVEL: the variable to be used for defining a term of the SMQ, e.g., AEDECOD • TERM_NAME: the name of the term if the variable TERM_LEVEL is referring to is character • TERM_ID the numeric id of the term if the variable TERM_LEVEL is referring to is numeric • QUERY_NAME: the name of the SMQ. The values must be the same for all observations. The function must provide the following parameters <ul style="list-style-type: none"> • smq_select: A smq_select() object. • version: The MedDRA version. The value specified for the meddra_version in the create_query_data() call is passed to this parameter. • keep_id: If set to TRUE, the output dataset must contain the QUERY_ID variable. The variable must be set to the numeric id of the SMQ. • temp_env: A temporary environment is passed to this parameter. It can be used to store data which is used for all SMQs in the create_query_data() call. For example if the SMQs need to be read from a database all SMQs can be read and stored in the environment when the first SMQ is handled. For the other SMQs the terms can be retrieved from the environment instead of accessing the database again. |
| get_sdg_fun | Function which returns the terms of an SDG For each query specified for the queries parameter which refers to an SDG the specified function is called to retrieve the terms defining the query. This |

function is not provided by admiral as it is company specific, i.e., it has to be implemented at company level.

The function must return a dataset with all the terms defining the SDG. The output dataset must contain the following variables.

- TERM_LEVEL: the variable to be used for defining a term of the SDG, e.g., CMDECOD
- TERM_NAME: the name of the term if the variable TERM_LEVEL is referring to is character
- TERM_ID the numeric id of the term if the variable TERM_LEVEL is referring to is numeric
- QUERY_NAME: the name of the SDG. The values must be the same for all observations.

The function must provide the following parameters

- sdg_select: A sdg_select() object.
- version: The WHO drug dictionary version. The value specified for the whodd_version in the create_query_data() call is passed to this parameter.
- keep_id: If set to TRUE, the output dataset must contain the QUERY_ID variable. The variable must be set to the numeric id of the SDG.
- temp_env: A temporary environment is passed to this parameter. It can be used to store data which is used for all SDGs in the create_query_data() call. For example if the SDGs need to be read from a database all SDGs can be read and stored in the environment when the first SDG is handled. For the other SDGs the terms can be retrieved from the environment instead of accessing the database again.

Details

For each query() object listed in the queries argument, the terms belonging to the query (TERM_LEVEL, TERM_NAME, TERM_ID) are determined with respect to the definition field of the query: if the definition field of the query() object is

- an smq_select() object, the terms are read from the SMQ database by calling the function specified for the get_smq_fun parameter.
- an sdg_select() object, the terms are read from the SDG database by calling the function specified for the get_sdg_fun parameter.
- a data frame, the terms stored in the data frame are used.
- a list of data frames and smq_select() objects, all terms from the data frames and all terms read from the SMQ database referenced by the smq_select() objects are collated.

The following variables (as described in [Queries Dataset Documentation](#)) are created:

- VAR_PREFIX: Prefix of the variables to be created by derive_vars_query() as specified by the prefix element.
- QUERY_NAME: Name of the query as specified by the name element.

- QUERY_ID: Id of the query as specified by the id element. If the id element is not specified for a query, the variable is set to NA. If the id element is not specified for any query, the variable is not created.
- QUERY_SCOPE: scope of the query as specified by the scope element of the smq_select() object. For queries not defined by a smq_select() object, the variable is set to NA. If none of the queries is defined by a smq_select() object, the variable is not created.
- QUERY_SCOPE_NUM: numeric scope of the query. It is set to 1 if the scope is broad. Otherwise it is set to '2'. If the add_scope_num element equals FALSE, the variable is set to NA. If the add_scope_num element equals FALSE for all SMQs or none of the queries is an SMQ, the variable is not created.
- TERM_LEVEL: Name of the variable used to identify the terms.
- TERM_NAME: Value of the term variable if it is a character variable.
- TERM_ID: Value of the term variable if it is a numeric variable.

Value

A dataset to be used as input dataset to the dataset_queries argument in derive_vars_query()

```

```
create_single_dose_dataset
```

Create dataset of single doses

Description

Derives dataset of single dose from aggregate dose information. This may be necessary when e.g. calculating last dose before an adverse event in ADAE or deriving a total dose parameter in ADEX when EXDOSFRQ != ONCE.

Usage

```

create_single_dose_dataset(
  dataset,
  dose_freq = EXDOSFRQ,
  start_date = ASTDT,
  start_datetime = ASTDTM,
  end_date = AENDT,
  end_datetime = AENDTM,
  lookup_table = dose_freq_lookup,
  lookup_column = CDISC_VALUE,
  keep_source_vars = vars(USUBJID, EXDOSFRQ, ASTDT, ASTDTM, AENDT, AENDTM)
)

```

Arguments

| | |
|-----------|---|
| dataset | Input dataset The columns specified by dose_freq, start_date and the end_date parameters are expected. |
| dose_freq | The dose frequency The aggregate dosing frequency used for multiple doses in a row. Default: EXDOSFRQ Permitted Values: defined by lookup table. |

| | |
|------------------|---|
| start_date | <p>The start date</p> <p>A date object is expected. This object cannot contain NA values.</p> <p>Refer to <code>derive_vars_dt()</code> to impute and derive a date from a date character vector to a date object.</p> <p>Default: ASTDT</p> |
| start_datetime | <p>The start date-time</p> <p>A date-time object is expected. This object cannot contain NA values.</p> <p>Refer to <code>derive_vars_dtm()</code> to impute and derive a date-time from a date character vector to a date object.</p> <p>Default: ASTDTM</p> |
| end_date | <p>The end date</p> <p>A date or date-time object is expected. This object cannot contain NA values.</p> <p>Refer to <code>derive_vars_dt()</code> to impute and derive a date from a date character vector to a date object.</p> <p>Default: AENDT</p> |
| end_datetime | <p>The end date-time</p> <p>A date-time object is expected. This object cannot contain NA values.</p> <p>Refer to <code>derive_vars_dtm()</code> to impute and derive a date-time from a date character vector to a date object.</p> <p>Default: AENDTM</p> |
| lookup_table | <p>The dose frequency value lookup table</p> <p>The table used to look up <code>dose_freq</code> values and determine the appropriate multiplier to be used for row generation. If a lookup table other than the default is used, it must have columns <code>DOSE_WINDOW</code>, <code>DOSE_COUNT</code>, and <code>CONVERSION_FACTOR</code>. The default table <code>dose_freq_lookup</code> is described in detail here.</p> <p>Default: <code>dose_freq_lookup</code></p> <p>Permitted Values for <code>DOSE_WINDOW</code>: "MINUTE", "HOUR", "DAY", "WEEK", "MONTH", "YEAR"</p> |
| lookup_column | <p>The dose frequency value column in the lookup table</p> <p>The column of <code>lookup_table</code>.</p> <p>Default: <code>CDISC_VALUE</code> (column of <code>dose_freq_lookup</code>)</p> |
| keep_source_vars | <p>List of variables to be retained from source dataset</p> <p>Default: <code>vars(USUBJID, EXDOSFRQ, ASTDT, ASTDTM, AENDT, AENDTM)</code></p> |

Details

Each aggregate dose row is split into multiple rows which each represent a single dose. The number of completed dose periods between `start_date` or `start_datetime` and `end_date` or `end_datetime` is calculated with `compute_duration` and multiplied by `DOSE_COUNT`. For `DOSE_WINDOW` values of "WEEK", "MONTH", and "YEAR", `CONVERSION_FACTOR` is used to convert into days the time object to be added to `start_date`.

Value

The input dataset with a single dose per row.

| | |
|-------------|------------------------------------|
| date_source | <i>Create a date_source object</i> |
|-------------|------------------------------------|

Description

Create a `date_source` object as input for `derive_var_extreme_dt()` and `derive_var_extreme_dtm()`.

Usage

```
date_source(
  dataset_name,
  filter = NULL,
  date,
  date_imputation = deprecated(),
  time_imputation = deprecated(),
  preserve = deprecated(),
  traceability_vars = NULL
)
```

Arguments

| | |
|--------------------------------|---|
| <code>dataset_name</code> | The name of the dataset, i.e. a string, used to search for the date. |
| <code>filter</code> | An unquoted condition for filtering dataset. |
| <code>date</code> | A variable providing a date. A date or a datetime can be specified. An unquoted symbol is expected. |
| <code>date_imputation</code> | <i>Deprecated</i> , please use <code>derive_vars_dtm()</code> to convert DTC variables to date-time variables in the dataset. |
| <code>time_imputation</code> | <i>Deprecated</i> , please use <code>derive_vars_dtm()</code> to convert DTC variables to date-time variables in the dataset. |
| <code>preserve</code> | <i>Deprecated</i> , please use <code>derive_vars_dtm()</code> to convert DTC variables to date-time variables in the dataset. |
| <code>traceability_vars</code> | A named list returned by <code>vars()</code> defining the traceability variables, e.g. <code>vars(LALVDOM = "AE", LALVSEQ = AESEQ, LALVVAR = "AESTDTC")</code> . The values must be a symbol, a character string, a numeric, or NA. |

Value

An object of class `date_source`.

  print(get(obj))
  cat("\n")
}
```

default_qtc_paramcd *Get Default Parameter Code for Corrected QT*

Description

Get Default Parameter Code for Corrected QT

Usage

```
default_qtc_paramcd(method)
```

Arguments

| | |
|--------|---|
| method | Method used to QT correction Permitted Values: "Bazett", "Fridericia", "Sagie" |
|--------|---|

Value

"QTCBR" if method is "Bazett", "QTCFR" if it's "Fridericia" or "QTLCR" if it's "Sagie". An error otherwise.

derivation_slice *Create a derivation_slice Object*

Description

Create a derivation_slice object as input for slice_derivation().

Usage

```
derivation_slice(filter, args)
```

Arguments

| | |
|--------|--|
| filter | An unquoted condition for defining the observations of the slice |
| args | Arguments of the derivation to be used for the slice A params() object is expected. |

Value

An object of class derivation_slice

An object of class slice.

Author(s)

Stefan Bundfuss

derive_derived_param *Adds a Parameter Computed from the Analysis Value of Other Parameters*

Description

[Deprecated]

This function is deprecated. Please use `derive_param-computed()` instead.

Usage

```
derive_derived_param(
  dataset,
  by_vars,
  parameters,
  analysis_value,
  set_values_to,
  filter = NULL,
  constant_by_vars = NULL,
  constant_parameters = NULL
)
```

Arguments

| | |
|----------------|--|
| dataset | Input dataset The variables specified by the <code>by_vars</code> parameter, <code>PARAMCD</code> , and <code>AVAL</code> are expected. The variable specified by <code>by_vars</code> and <code>PARAMCD</code> must be a unique key of the input dataset after restricting it by the filter condition (<code>filter</code> parameter) and to the parameters specified by <code>parameters</code> . |
| by_vars | Grouping variables For each group defined by <code>by_vars</code> an observation is added to the output dataset. Only variables specified in <code>by_vars</code> will be populated in the newly created records. <i>Permitted Values:</i> list of variables |
| parameters | Required parameter codes It is expected that all parameter codes (<code>PARAMCD</code>) which are required to derive the new parameter are specified for this parameter or the <code>constant_parameters</code> parameter. <i>Permitted Values:</i> A character vector of <code>PARAMCD</code> values |
| analysis_value | Definition of the analysis value An expression defining the analysis value (<code>AVAL</code>) of the new parameter is expected. The analysis values of the parameters specified by <code>parameters</code> can be accessed using <code>AVAL.<parameter code></code> , e.g., <code>AVAL.SYSBP</code> . <i>Permitted Values:</i> An unquoted expression |

| | |
|---------------------|--|
| set_values_to | <p>Variables to be set</p> <p>The specified variables are set to the specified values for the new observations. For example <code>vars(PARAMCD = "MAP")</code> defines the parameter code for the new parameter.</p> <p><i>Permitted Values:</i> List of variable-value pairs</p> |
| filter | <p>Filter condition</p> <p>The specified condition is applied to the input dataset before deriving the new parameter, i.e., only observations fulfilling the condition are taken into account.</p> <p><i>Permitted Values:</i> a condition</p> |
| constant_by_vars | <p>By variables for constant parameters</p> <p>The constant parameters (parameters that are measured only once) are merged to the other parameters using the specified variables. (Refer to Example 2)</p> <p><i>Permitted Values:</i> list of variables</p> |
| constant_parameters | <p>Required constant parameter codes</p> <p>It is expected that all the parameter codes (PARAMCD) which are required to derive the new parameter and are measured only once are specified here. For example if BMI should be derived and height is measured only once while weight is measured at each visit. Height could be specified in the <code>constant_parameters</code> parameter. (Refer to Example 2)</p> <p><i>Permitted Values:</i> A character vector of PARAMCD values</p> |

Value

The input dataset with the new parameter added. Note, a variable will only be populated in the new parameter rows if it is specified in `by_vars`.

derive_extreme_records

Add the First or Last Observation for Each By Group as New Records

Description

Add the first or last observation for each by group as new observations. It can be used for example for adding the maximum or minimum value as a separate visit. All variables of the selected observation are kept. This distinguishes `derive_extreme_records()` from `derive_summary_records()`, where only the by variables are populated for the new records.

Usage

```

derive_extreme_records(
  dataset,
  by_vars = NULL,
  order,
  mode,
  check_type = "warning",
  filter = NULL,
  set_values_to
)

```

Arguments

| | |
|---------------|---|
| dataset | Input dataset The variables specified by the order and the by_vars parameter are expected. |
| by_vars | Grouping variables <i>Default:</i> NULL <i>Permitted Values:</i> list of variables created by vars() |
| order | Sort order Within each by group the observations are ordered by the specified order. <i>Permitted Values:</i> list of variables or desc(<variable>) function calls created by vars(), e.g., vars(ADT, desc(AVAL)) |
| mode | Selection mode (first or last) If "first" is specified, the first observation of each by group is added to the input dataset. If "last" is specified, the last observation of each by group is added to the input dataset. <i>Permitted Values:</i> "first", "last" |
| check_type | Check uniqueness? If "warning" or "error" is specified, the specified message is issued if the observations of the input dataset are not unique with respect to the by variables and the order. <i>Default:</i> "warning" <i>Permitted Values:</i> "none", "warning", "error" |
| filter | Filter for observations to consider Only observations fulfilling the specified condition are taken into account for selecting the first or last observation. If the parameter is not specified, all observations are considered. <i>Default:</i> NULL <i>Permitted Values:</i> a condition |
| set_values_to | Variables to be set The specified variables are set to the specified values for the new observations. A list of variable name-value pairs is expected. <ul style="list-style-type: none"> • LHS refers to a variable. • RHS refers to the values to set to the variable. This can be a string, a symbol, a numeric value or NA, e.g., vars(PARAMCD = "TDOSE", PARCAT1 = "OVERALL"). More general expression are not allowed. |

Details

1. The input dataset is restricted as specified by the `filter` parameter.
2. For each group (with respect to the variables specified for the `by_vars` parameter) the first or last observation (with respect to the order specified for the `order` parameter and the mode specified for the `mode` parameter) is selected.
3. The variables specified by the `set_values_to` parameter are added to the selected observations.
4. The observations are added to input dataset.

Value

The input dataset with the first or last observation of each by group added as new observations.

|------------------|---------------------------------|
| derive_param_bmi | <i>Adds a Parameter for BMI</i> |
|------------------|---------------------------------|

Description

Adds a record for BMI/Body Mass Index using Weight and Height each by group (e.g., subject and visit) where the source parameters are available.

Usage

```

derive_param_bmi(
  dataset,
  by_vars,
  set_values_to = vars(PARAMCD = "BMI"),
  weight_code = "WEIGHT",
  height_code = "HEIGHT",
  get_unit_expr,
  filter = NULL
)

```

Arguments

| | |

`derive_param_computed` *Adds a Parameter Computed from the Analysis Value of Other Parameters*

Description

Adds a parameter computed from the analysis value of other parameters. It is expected that the analysis value of the new parameter is defined by an expression using the analysis values of other parameters. For example mean arterial pressure (MAP) can be derived from systolic (SYSBP) and diastolic blood pressure (DIABP) with the formula

$$MAP = \frac{SYSBP + 2DIABP}{3}$$

Usage

```

derive_param_computed(
  dataset,
  by_vars,
  parameters,
  analysis_value,
  set_values_to,
  filter = NULL,
  constant_by_vars = NULL,
  constant_parameters = NULL
)

```

Arguments

(Refer to Example 2)</p> <p><i>Permitted Values:</i> A character vector of PARAMCD values</p> |

Details

For each group (with respect to the variables specified for the by_vars parameter) an observation is added to the output dataset if the filtered input dataset contains exactly one observation for each parameter code specified for parameters.

For the new observations AVAL is set to the value specified by analysis_value and the variables specified for set_values_to are set to the provided values. The values of the other variables of the input dataset are set to NA.

Value

The input dataset with the new parameter added. Note, a variable will only be populated in the new parameter rows if it is specified in `by_vars`.

```

derive_param_doseint *Adds a Parameter for Dose Intensity*

Description

Adds a record for the dose intensity for each by group (e.g., subject and visit) where the source parameters are available.

Usage

```

derive_param_doseint(
  dataset,
  by_vars,
  set_values_to = vars(PARAMCD = "TNDOSINT"),
  tadm_code = "TNDOSE",
  tpadm_code = "TSNDOSE",
  zero_doses = "Inf",
  filter = NULL
)

```

Arguments

| | |
|---------|---------------|
| dataset | Input dataset |
|---------|---------------|

The variables specified by the `by_vars` parameter, `PARAMCD`, and `AVAL` are expected.

The variable specified by `by_vars` and `PARAMCD` must be a unique key of the input dataset after restricting it by the filter condition (`filter` parameter) and to the parameters specified by `tadm_code` and `padm_code`.

| | |
|---------------|--|
| by_vars | <p>Grouping variables</p> <p>Only variables specified in by_vars will be populated in the newly created records.</p> <p>Permitted Values: list of variables</p> |
| set_values_to | <p>Variables to be set</p> <p>The specified variables are set to the specified values for the new observations. For example vars(PARAMCD = "MAP") defines the parameter code for the new parameter.</p> <p><i>Permitted Values:</i> List of variable-value pairs</p> |
| tadm_code | <p>Total Doses Administered parameter code</p> <p>The observations where PARAMCD equals the specified value are considered as the total dose administered. The AVAL associated with this PARAMCD will be the numerator of the dose intensity calculation.</p> <p>Permitted Values: character value</p> |
| tpadm_code | <p>Total Doses Planned parameter code</p> <p>The observations where PARAMCD equals the specified value are considered as the total planned dose. The AVAL associated with this PARAMCD will be the denominator of the dose intensity calculation.</p> <p>Permitted Values: character value</p> |
| zero_doses | <p>Flag indicating logic for handling 0 planned or administered doses for a by_vars group</p> <p>Default: Inf</p> <p>Permitted Values: Inf, 100</p> <p>No record is returned if either the planned (tpadm_code) or administered (tadm_code) AVAL are NA. No record is returned if a record does not exist for both tadm_code and tpadm_code for the specified by_var.</p> <p>If zero_doses = Inf:</p> <ol style="list-style-type: none"> 1. If the planned dose (tpadm_code) is 0 and administered dose (tadm_code) is 0, NaN is returned. 2. If the planned dose (tpadm_code) is 0 and the administered dose (tadm_code) is > 0, Inf is returned. <p>If zero_doses = 100 :</p> <ol style="list-style-type: none"> 1. If the planned dose (tpadm_code) is 0 and administered dose (tadm_code) is 0, 0 is returned. 2. If the planned dose (tpadm_code) is 0 and the administered dose (tadm_code) is > 0, 100 is returned. |
| filter | <p>Filter condition</p> <p>The specified condition is applied to the input dataset before deriving the new parameter, i.e., only observations fulfilling the condition are taken into account.</p> <p><i>Permitted Values:</i> a condition</p> |

Details

The analysis value of the new parameter is derived as Total Dose / Planned Dose * 100

Value

The input dataset with the new parameter rows added. Note, a variable will only be populated in the new parameter rows if it is specified in `by_vars`.

)
```

 derive_param_exist_flag

Add an Existence Flag Parameter

Description

Add a new parameter indicating that a certain event exists in a dataset. AVALC and AVAL indicate if an event occurred or not. For example, the function can derive a parameter indicating if there is measureable disease at baseline.

Usage

```
derive_param_exist_flag(
  dataset = NULL,
  dataset_adsl,
  dataset_add,
  condition,
  true_value = "Y",
  false_value = NA_character_,
  missing_value = NA_character_,
  filter_add = NULL,
  aval_fun = yn_to_numeric,
  subject_keys = vars(STUDYID, USUBJID),
  set_values_to
)
```

Arguments

| | |
|--------------|---|
| dataset | Input dataset The variables specified for subject_keys and the PARAMCD variable are expected. |
| dataset_adsl | ADSL input dataset The variables specified for subject_keys are expected. For each subject (as defined by subject_keys) from the specified dataset (dataset_adsl), the existence flag is calculated and added as a new observation to the input datasets (dataset) |
| dataset_add | Additional dataset The variables specified by the subject_keys parameter are expected. This dataset is used to check if an event occurred or not. Any observation in the dataset fulfilling the event condition (condition) is considered as an event. |
| condition | Event condition The condition is evaluated at the additional dataset (dataset_add). For all subjects where it evaluates as TRUE at least once AVALC is set to the true value (true_value) for the new observations. |

| | |
|---------------|---|
| | <p>For all subjects where it evaluates as FALSE or NA for all observations AVALC is set to the false value (false_value).</p> <p>For all subjects not present in the additional dataset AVALC is set to the missing value (missing_value).</p> |
| true_value | <p>True value</p> <p>For all subjects with at least one observations in the additional dataset (dataset_add) fulfilling the event condition (condition), AVALC is set to the specified value (true_value).</p> <p><i>Default:</i> "Y"</p> <p><i>Permitted Value:</i> A character scalar</p> |
| false_value | <p>False value</p> <p>For all subjects with at least one observations in the additional dataset (dataset_add) but none of them is fulfilling the event condition (condition), AVALC is set to the specified value (false_value).</p> <p><i>Default:</i> NA_character_</p> <p><i>Permitted Value:</i> A character scalar</p> |
| missing_value | <p>Values used for missing information</p> <p>For all subjects without an observation in the additional dataset (dataset_add), AVALC is set to the specified value (missing_value).</p> <p><i>Default:</i> NA_character_</p> <p><i>Permitted Value:</i> A character scalar</p> |
| filter_add | <p>Filter for additional data</p> <p>Only observations fulfilling the specified condition are taken into account for flagging. If the parameter is not specified, all observations are considered.</p> <p><i>Permitted Values:</i> a condition</p> |
| aval_fun | <p>Function to map character analysis value (AVALC) to numeric analysis value (AVAL)</p> <p>The (first) argument of the function must expect a character vector and the function must return a numeric vector.</p> <p><i>Default:</i> yn_to_numeric (see yn_to_numeric() for details)</p> |
| subject_keys | <p>Variables to uniquely identify a subject</p> <p>A list of symbols created using vars() is expected.</p> |
| set_values_to | <p>Variables to set</p> <p>A named list returned by vars() defining the variables to be set for the new parameter, e.g. vars(PARAMCD = "MDIS", PARAM = "Measurable Disease at Baseline") is expected. The values must be symbols, character strings, numeric values, or NA.</p> |

Details

1. The additional dataset (dataset_add) is restricted to the observations matching the filter_add condition.
2. For each subject in dataset_ads1 a new observation is created.

- The AVALC variable is added and set to the true value (`true_value`) if for the subject at least one observation exists in the (restricted) additional dataset where the condition evaluates to TRUE.
 - It is set to the false value (`false_value`) if for the subject at least one observation exists and for all observations the condition evaluates to FALSE or NA.
 - Otherwise, it is set to the missing value (`missing_value`), i.e., for those subject not in `dataset_add`.
3. The AVAL variable is added and set to `aval_fun(AVALC)`.
 4. The variables specified by the `set_values_to` parameter are added to the new observations.
 5. The new observations are added to input dataset.

Value

The input dataset with a new parameter indicating if an event occurred (AVALC, AVAL, and the variables specified by `subject_keys` and `set_value_to` are populated for the new parameter)

)

```

derive_param_exposure *Add an Aggregated Parameter and Derive the Associated Start and End Dates*

Description

Add a record computed from the aggregated analysis value of another parameter and compute the start (ASTDT(M)) and end date (AENDT(M)) as the minimum and maximum date by by_vars.

Usage

```

derive_param_exposure(
  dataset,
  by_vars,
  input_code,
  analysis_var,
  summary_fun,
  filter = NULL,
  set_values_to = NULL
)

```

Arguments

| | |
|---------|---|
| dataset | Input dataset |
| | <ul style="list-style-type: none"> The variables specified by the by_vars, analysis_var parameters and PARAMCD are expected, Either ASTDTM and AENDTM or ASTDT and AENDT are also expected. |
| by_vars | Grouping variables |

| | |
|----------------------------|---|
| | For each group defined by <code>by_vars</code> an observation is added to the output dataset. Only variables specified in <code>by_vars</code> will be populated in the newly created records. |
| | <i>Permitted Values:</i> list of variables |
| <code>input_code</code> | Required parameter code The observations where <code>PARAMCD</code> equals the specified value are considered to compute the summary record. <i>Permitted Values:</i> A character of <code>PARAMCD</code> value |
| <code>analysis_var</code> | Analysis variable. |
| <code>summary_fun</code> | Function that takes as an input the <code>analysis_var</code> and performs the calculation. This can include built-in functions as well as user defined functions, for example <code>mean</code> or <code>function(x) mean(x, na.rm = TRUE)</code> . |
| <code>filter</code> | Filter condition The specified condition is applied to the input dataset before deriving the new parameter, i.e., only observations fulfilling the condition are taken into account. <i>Permitted Values:</i> a condition |
| <code>set_values_to</code> | Variable-value pairs Set a list of variables to some specified value for the new observation(s) <ul style="list-style-type: none"> • LHS refer to a variable. It is expected that at least <code>PARAMCD</code> is defined. • RHS refers to the values to set to the variable. This can be a string, a symbol, a numeric value or NA. (e.g. <code>vars(PARAMCD = "TDOSE", PARCAT1 = "OVERALL")</code>). More general expression are not allowed. <i>Permitted Values:</i> List of variable-value pairs |

Details

For each group (with respect to the variables specified for the `by_vars` parameter), an observation is added to the output dataset and the defined values are set to the defined variables

Value

The input dataset with a new record added for each group (with respect to the variables specified for the `by_vars` parameter). That is, a variable will only be populated in this new record if it is specified in `by_vars`. For each new record,

- the variable specified `analysis_var` is computed as defined by `summary_fun`,
- the variable(s) specified on the LHS of `set_values_to` are set to their paired value (RHS). In addition, the start and end date are computed as the minimum/maximum dates by `by_vars`.

If the input datasets contains

- both `AxxDTM` and `AxxDT` then all `ASTDTM`, `AENDTM`, `ASTDT`, `AENDT` are computed
- only `AxxDTM` then `ASTDTM`, `AENDTM` are computed
- only `AxxDT` then `ASTDT`, `AENDT` are computed.

select(-ASTDTM, -AENDTM)

```

derive_param_first_event

Add a First Event Parameter

Description

Add a new parameter for the first event occurring in a dataset. AVALC and AVALL indicate if an event occurred and ADT is set to the date of the first event. For example, the function can derive a parameter for the first disease progression.

Usage

```

derive_param_first_event(
  dataset,
  dataset_adsl,
  dataset_source,
  filter_source,
  date_var,
  subject_keys = vars(STUDYID, USUBJID),
  set_values_to,
  check_type = "warning"
)

```

Arguments

| | |
|--------------|---|
| dataset | Input dataset The PARAMCD variable is expected. |
| dataset_adsl | ADSL input dataset The variables specified for subject_keys are expected. For each observation of the specified dataset a new observation is added to the input dataset. |

| | |
|----------------|--|
| dataset_source | Source dataset All observations in the specified dataset fulfilling the condition specified by filter_source are considered as event. The variables specified by the subject_keys and date_var parameter are expected. |
| filter_source | Source filter All observations in dataset_source fulfilling the specified condition are considered as event. For subjects with at least one event AVALC is set to "Y", AVAL to 1, and ADT to the first date where the condition is fulfilled. For all other subjects AVALC is set to "N", AVAL to 0, and ADT to NA. |
| date_var | Date variable Date variable in the source dataset (dataset_source). The variable is used to sort the source dataset. ADT is set to the specified variable for events. |
| subject_keys | Variables to uniquely identify a subject A list of symbols created using vars() is expected. |
| set_values_to | Variables to set A named list returned by vars() defining the variables to be set for the new parameter, e.g. vars(PARAMCD = "PD", PARAM = "Disease Progression") is expected. The values must be symbols, character strings, numeric values, or NA. |
| check_type | Check uniqueness? If "warning" or "error" is specified, a message is issued if the observations of the input dataset restricted to the source parameter (source_param) are not unique with respect to the subject keys (subject_key parameter) and ADT. <i>Default: "warning"</i> <i>Permitted Values: "none", "warning", "error"</i> |

Details

1. The input dataset is restricted to observations fulfilling filter_source.
2. For each subject (with respect to the variables specified for the subject_keys parameter) the first observation (with respect to date_var) where the event condition (filter_source parameter) is fulfilled is selected.
3. For each observation in dataset_adsl a new observation is created. For subjects with event AVALC is set to "Y", AVAL to 1, and ADT to the first date where the event condition is fulfilled. For all other subjects AVALC is set to "N", AVAL to 0, and ADT to NA. For subjects with event all variables from dataset_source are kept. For subjects without event all variables which are in both dataset_adsl and dataset_source are kept.
4. The variables specified by the set_values_to parameter are added to the new observations.
5. The new observations are added to input dataset.

Value

The input dataset with a new parameter indicating if and when an event occurred

derive_param_framingham

Adds a Parameter for Framingham Heart Study Cardiovascular Disease 10-Year Risk Score

Description

Adds a record for framingham score (FCVD101) for each by group (e.g., subject and visit) where the source parameters are available.

Usage

```

derive_param_framingham(
  dataset,
  by_vars,
  set_values_to = vars(PARAMCD = "FCVD101"),
  sysbp_code = "SYSBP",
  chol_code = "CHOL",
  cholhdl_code = "CHOLHDL",
  age = AGE,
  sex = SEX,
  smokefl = SMOKEFL,
  diabetfl = DIABETFL,
  trthypfl = TRTHYPFL,
  get_unit_expr,
  filter = NULL
)

```

Arguments

| | |
|---------------|--|
| dataset | <p>Input dataset</p> <p>The variables specified by the <code>by_vars</code> parameter, <code>PARAMCD</code>, and <code>AVAL</code> are expected.</p> <p>The variable specified by <code>by_vars</code> and <code>PARAMCD</code> must be a unique key of the input dataset after restricting it by the filter condition (<code>filter</code> parameter) and to the parameters specified by <code>sysbp_code</code>, <code>chol_code</code> and <code>hdl_code</code>.</p> |
| by_vars | <p>Grouping variables</p> <p>For each group defined by <code>by_vars</code> an observation is added to the output dataset. Only variables specified in <code>by_vars</code> will be populated in the newly created records.</p> <p><i>Permitted Values:</i> list of variables</p> |
| set_values_to | <p>Variables to be set</p> <p>The specified variables are set to the specified values for the new observations. For example <code>vars(PARAMCD = "MAP")</code> defines the parameter code for the new parameter.</p> <p><i>Permitted Values:</i> List of variable-value pairs</p> |
| sysbp_code | <p>Systolic blood pressure parameter code</p> <p>The observations where <code>PARAMCD</code> equals the specified value are considered as the systolic blood pressure assessments.</p> <p><i>Permitted Values:</i> character value</p> |
| chol_code | <p>Total serum cholesterol code</p> <p>The observations where <code>PARAMCD</code> equals the specified value are considered as the total cholesterol assessments. This must be measured in mg/dL.</p> <p><i>Permitted Values:</i> character value</p> |
| cholhdl_code | <p>HDL serum cholesterol code</p> <p>The observations where <code>PARAMCD</code> equals the specified value are considered as the HDL cholesterol assessments. This must be measured in mg/dL.</p> <p><i>Permitted Values:</i> character value</p> |
| age | <p>Subject age</p> <p>A variable containing the subject's age.</p> <p><i>Permitted Values:</i> A numeric variable name that refers to a subject age column of the input dataset</p> |
| sex | <p>Subject sex</p> <p>A variable containing the subject's sex.</p> <p><i>Permitted Values:</i> A character variable name that refers to a subject sex column of the input dataset</p> |
| smokefl | <p>Smoking status flag</p> <p>A flag indicating smoking status.</p> <p><i>Permitted Values:</i> A character variable name that refers to a smoking status column of the input dataset.</p> |

| | |
|---------------|---|
| diabetfl | Diabetic flag A flag indicating diabetic status. <i>Permitted Values:</i> A character variable name that refers to a diabetic status column of the input dataset |
| trthypfl | Treated with hypertension medication flag A flag indicating if a subject was treated with hypertension medication. <i>Permitted Values:</i> A character variable name that refers to a column that indicates whether a subject is treated for high blood pressure |
| get_unit_expr | An expression providing the unit of the parameter The result is used to check the units of the input parameters. <i>Permitted Values:</i> A variable of the input dataset or a function call |
| filter | Filter condition The specified condition is applied to the input dataset before deriving the new parameter, i.e., only observations fulfilling the condition are taken into account. <i>Permitted Values:</i> a condition |

Details

The values of age, sex, smokefl, diabetfl and trthypfl will be added to the by_vars list. The predicted probability of having cardiovascular disease (CVD) within 10-years according to Framingham formula [D'Agostino, 2008](#) is: # nolint **For Women:**

| Factor | Amount |
|----------------------------|----------|
| Age | 2.32888 |
| Total Chol | 1.20904 |
| HDL Chol | -0.70833 |
| Sys BP | 2.76157 |
| Sys BP + Hypertension Meds | 2.82263 |
| Smoker | 0.52873 |
| Non-Smoker | 0 |
| Diabetic | 0.69154 |
| Not Diabetic | 0 |
| Average Risk | 26.1931 |
| Risk Period | 0.95012 |

For Men:

| Factor | Amount |
|----------------------------|----------|
| Age | 3.06117 |
| Total Chol | 1.12370 |
| HDL Chol | -0.93263 |
| Sys BP | 1.93303 |
| Sys BP + Hypertension Meds | 2.99881 |
| Smoker | .65451 |
| Non-Smoker | 0 |
| Diabetic | 0.57367 |

| | |
|--------------|---------|
| Not Diabetic | 0 |
| Average Risk | 23.9802 |
| Risk Period | 0.88936 |

The equation for calculating risk:

$$RiskFactors = (\log(Age)*AgeFactor) + (\log(TotalChol)*TotalCholFactor) + (\log(CholHDL)*CholHDLFactor)$$

$$Risk = 100 * (1 - RiskPeriodFactor^{RiskFactors})$$

Value

The input dataset with the new parameter added

Details

The analysis value of the new parameter is derived as

$$\frac{2DIABP + SYSBP}{3}$$

if it is based on diastolic and systolic blood pressure and

$$DIABP + 0.01e^{4.14 - \frac{40.74}{HR}} (SYSBP - DIABP)$$

if it is based on diastolic, systolic blood pressure, and heart rate.

Value

The input dataset with the new parameter added. Note, a variable will only be populated in the new parameter rows if it is specified in `by_vars`.

filter Filter condition
 The specified condition is applied to the input dataset before deriving the new parameter, i.e., only observations fulfilling the condition are taken into account.
Permitted Values: a condition

Details

The analysis value of the new parameter is derived as

$$\frac{60000}{HR}$$

Value

The input dataset with the new parameter added. Note, a variable will only be populated in the new parameter rows if it is specified in `by_vars`.

```

```
)
```

```
derive_param_tte      Derive a Time-to-Event Parameter
```

Description

Add a time-to-event parameter to the input dataset.

Usage

```
derive_param_tte(
  dataset = NULL,
  dataset_adsl,
  source_datasets,
  by_vars = NULL,
  start_date = TRTSDT,
  event_conditions,
  censor_conditions,
  create_datetime = FALSE,
  set_values_to,
  subject_keys = vars(STUDYID, USUBJID)
)
```

Arguments

| | |
|-----------------|---|
| dataset | Input dataset The PARAMCD variable is expected. |
| dataset_adsl | ADSL input dataset The variables specified for start_date, start_imputation_flag, and subject_keys are expected. |
| source_datasets | Source datasets A named list of datasets is expected. The dataset_name field of tte_source() refers to the dataset provided in the list. |
| by_vars | By variables If the parameter is specified, separate time to event parameters are derived for each by group. The by variables must be in at least one of the source datasets. Each source dataset must contain either all by variables or none of the by variables. The by variables are not included in the output dataset. |
| start_date | Time to event origin date The variable STARTDT is set to the specified date. The value is taken from the ADSL dataset. |

| | |
|--------------------------------|---|
| | If the event or censoring date is before the origin date, ADT is set to the origin date. |
| | If the specified variable is imputed, the corresponding date imputation flag must be specified for <code>start_imputation_flag</code> . |
| <code>event_conditions</code> | Sources and conditions defining events A list of <code>event_source()</code> objects is expected. |
| <code>censor_conditions</code> | Sources and conditions defining censorings A list of <code>censor_source()</code> objects is expected. |
| <code>create_datetime</code> | Create datetime variables? If set to TRUE, variables ADTM and STARTDTM are created. Otherwise, variables ADT and STARTDT are created. |
| <code>set_values_to</code> | Variables to set A named list returned by <code>vars()</code> defining the variables to be set for the new parameter, e.g. <code>vars(PARAMCD = "OS", PARAM = "Overall Survival")</code> is expected. The values must be symbols, character strings, numeric values, expressions, or NA. |
| <code>subject_keys</code> | Variables to uniquely identify a subject A list of symbols created using <code>vars()</code> is expected. |

Details

The following steps are performed to create the observations of the new parameter:

Deriving the events:

1. For each event source dataset the observations as specified by the `filter` element are selected. Then for each patient the first observation (with respect to date) is selected.
2. The ADT variable is set to the variable specified by the `date` element. If the date variable is a datetime variable, only the datepart is copied.
3. The CNSR variable is added and set to the `censor` element.
4. The variables specified by the `set_values_to` element are added.
5. The selected observations of all event source datasets are combined into a single dataset.
6. For each patient the first observation (with respect to the ADT variable) from the single dataset is selected.

Deriving the censoring observations:

1. For each censoring source dataset the observations as specified by the `filter` element are selected. Then for each patient the last observation (with respect to date) is selected.
2. The ADT variable is set to the variable specified by the `date` element. If the date variable is a datetime variable, only the datepart is copied.
3. The CNSR variable is added and set to the `censor` element.

4. The variables specified by the `set_values_to` element are added.
5. The selected observations of all censoring source datasets are combined into a single dataset.
6. For each patient the last observation (with respect to the ADT variable) from the single dataset is selected.

For each subject (as defined by the `subject_keys` parameter) an observation is selected. If an event is available, the event observation is selected. Otherwise the censoring observation is selected.

Finally

1. the variables specified for `start_date` and `start_imputation_flag` are joined from the ADSL dataset,
2. the variables as defined by the `set_values_to` parameter are added,
3. the ADT/ADTM variable is set to the maximum of ADT/ADTM and STARTDT/STARTDTM (depending on the `create_datetime` parameter), and
4. the new observations are added to the output dataset.

Value

The input dataset with the new parameter added

select(USUBJID, STARTDT, PARAMCD, PARAM, ADT, CNSR, SRCSEQ)

```

derive_param_wbc_abs *Add a parameter for lab differentials converted to absolute values*

Description

Add a parameter by converting lab differentials from fraction or percentage to absolute values

Usage

```

derive_param_wbc_abs(
  dataset,
  by_vars,
  set_values_to,
  get_unit_expr,
  wbc_unit = "10^9/L",
  wbc_code = "WBC",
  diff_code,
  diff_type = "fraction"
)

```

Arguments

| | |
|---------|---------------|
| dataset | Input dataset |
|---------|---------------|

| | |
|----------------------------|---|
| | The variables specified by the <code>by_vars</code> argument, <code>PARAMCD</code> , and <code>AVAL</code> are expected to be present. |
| | The variable specified by <code>by_vars</code> and <code>PARAMCD</code> must be a unique key of the input dataset, and to the parameters specified by <code>wbc_code</code> and <code>diff_code</code> . |
| <code>by_vars</code> | Grouping variables Permitted Values: list of variables |
| <code>set_values_to</code> | Variables to set A named list returned by <code>vars()</code> defining the variables to be set for the new parameter, e.g. <code>vars(PARAMCD = "LYMPH", PARAM = "Lymphocytes Abs (10^9/L)")</code> is expected. |
| <code>get_unit_expr</code> | An expression providing the unit of the parameter The result is used to check the units of the input parameters. Permitted Values: a variable containing unit from the input dataset, or a function call, for example, <code>get_unit_expr = extract_unit(PARAM)</code> . |
| <code>wbc_unit</code> | A string containing the required unit of the WBC parameter Default: "10^9/L" |
| <code>wbc_code</code> | White Blood Cell (WBC) parameter The observations where <code>PARAMCD</code> equals the specified value are considered as the WBC absolute results to use for converting the differentials. Default: "WBC" Permitted Values: character value |
| <code>diff_code</code> | white blood differential parameter The observations where <code>PARAMCD</code> equals the specified value are considered as the white blood differential lab results in fraction or percentage value to be converted into absolute value. |
| <code>diff_type</code> | A string specifying the type of differential Permitted Values: "percent", "fraction" Default: fraction |

Details

If `diff_type` is "percent", the analysis value of the new parameter is derived as

$$\frac{WhiteBloodCellCount * PercentageValue}{100}$$

If `diff_type` is "fraction", the analysis value of the new parameter is derived as

$$WhiteBloodCellCount * FractionValue$$

New records are created for each group of records (grouped by `by_vars`) if 1) the white blood cell component in absolute value is not already available from the input dataset, and 2) the white blood cell absolute value (identified by `wbc_code`) and the white blood cell differential (identified by `diff_code`) are both present.

Value

The input dataset with the new parameter added

 derive_summary_records

Add New Records Within By Groups Using Aggregation Functions

Description

It is not uncommon to have an analysis need whereby one needs to derive an analysis value (AVAL) from multiple records. The ADaM basic dataset structure variable DTYPE is available to indicate when a new derived records has been added to a dataset.

Usage

```
derive_summary_records(
  dataset,
  by_vars,
  filter = NULL,
  analysis_var,
  summary_fun,
  set_values_to = NULL
)
```

Arguments

| | |
|---------------|---|
| dataset | A data frame. |
| by_vars | Variables to consider for generation of groupwise summary records. Providing the names of variables in <code>vars()</code> will create a groupwise summary and generate summary records for the specified groups. |
| filter | Filter condition as logical expression to apply during summary calculation. By default, filtering expressions are computed within <code>by_vars</code> as this will help when an aggregating, lagging, or ranking function is involved. For example, <ul style="list-style-type: none"> • <code>filter = (AVAL > mean(AVAL, na.rm = TRUE))</code> will filter all AVAL values greater than mean of AVAL with in <code>by_vars</code>. • <code>filter = (dplyr::n() > 2)</code> will filter n count of <code>by_vars</code> greater than 2. |
| analysis_var | Analysis variable. |
| summary_fun | Function that takes as an input the <code>analysis_var</code> and performs the calculation. This can include built-in functions as well as user defined functions, for example <code>mean</code> or <code>function(x) mean(x, na.rm = TRUE)</code> . |
| set_values_to | Variables to be set The specified variables are set to the specified values for the new observations. A list of variable name-value pairs is expected. <ul style="list-style-type: none"> • LHS refers to a variable. • RHS refers to the values to set to the variable. This can be a string, a symbol, a numeric value or NA, e.g., <code>vars(PARAMCD = "TDOSE", PARCAT1 = "OVERALL")</code>. More general expression are not allowed. |

Details

When all records have same values within `by_vars` then this function will retain those common values in the newly derived records. Otherwise new value will be set to NA.

Value

A data frame with derived records appended to original dataset.

 derive_vars_age

Derive Analysis Age

Description

Derives analysis age (AGE) and analysis age unit (AAGEU)

Usage

```
derive_vars_age(
  dataset,
  start_date = BRTHDT,
  end_date = RANDDT,
  unit = "years"
)
```

Arguments

| | |
|------------|--|
| dataset | Input dataset The columns specified by the start_date and the end_date parameter are expected. |
| start_date | The start date A date or date-time object is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. Default: BRTHDT |
| end_date | The end date A date or date-time object is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. Default: RANDDT |
| unit | Unit The age is derived in the specified unit Default: 'years' Permitted Values: 'years', 'months', 'weeks', 'days', 'hours', 'minutes', 'seconds' |

Details

The age is derived as the integer part of the duration from start to end date in the specified unit. When 'years' or 'months' are specified in the out_unit parameter, because of the underlying lubridate::time_length() function that is used here, results are calculated based on the actual calendar length of months or years rather than assuming equal days every month (30.4375 days) or every year (365.25 days).

Value

The input dataset with AGE and AGEU added

derive_vars_atc

Derive ATC Class Variables

Description

Add Anatomical Therapeutic Chemical class variables from FACM to ADCM

Usage

```
derive_vars_atc(
  dataset,
  dataset_facm,
  by_vars = vars(USUBJID, CMREFID = FAREFID),
  value_var = FASTRESC
)
```

Arguments

| | |
|--------------|--|
| dataset | Input dataset The variables specified by the <code>by_vars</code> parameter are required |
| dataset_facm | FACM dataset The variables specified by the <code>by_vars</code> and <code>value_var</code> parameters, <code>FAGRPID</code> and <code>FATESTCD</code> are required |
| by_vars | Keys used to merge <code>dataset_facm</code> with <code>dataset</code> <i>Permitted Values:</i> list of variables |
| value_var | The variable of <code>dataset_facm</code> containing the values of the transposed variables Default: <code>FASTRESC</code> |

Value

The input dataset with ATC variables added

)

derive_vars_atc(cm, facm)
```

derive_vars_disposition_reason

Derive a Disposition Reason at a Specific Timepoint

Description

Derive a disposition reason from the the relevant records in the disposition domain.

Usage

```

derive_vars_disposition_reason(
  dataset,
  dataset_ds,
  new_var,
  reason_var,
  new_var_spe = NULL,
  reason_var_spe = NULL,
  format_new_vars = format_reason_default,
  filter_ds,
  subject_keys = vars(STUDYID, USUBJID)
)

```

Arguments

| | |
|-----------------|---|
| dataset | Input dataset |
| dataset_ds | Dataset containing the disposition information (e.g. ds) The dataset must contain: <ul style="list-style-type: none"> • STUDYID, USUBJID, • The variable(s) specified in the reason_var (and reason_var_spe, if required) • The variables used in filter_ds. |
| new_var | Name of the disposition reason variable A variable name is expected (e.g. DCSREAS). |
| reason_var | The variable used to derive the disposition reason A variable name is expected (e.g. DSDECOD). |
| new_var_spe | Name of the disposition reason detail variable A variable name is expected (e.g. DCSREASP). If new_var_spe is specified, it is expected that reason_var_spe is also specified, otherwise an error is issued. Default: NULL |
| reason_var_spe | The variable used to derive the disposition reason detail A variable name is expected (e.g. DSTERM). If new_var_spe is specified, it is expected that reason_var_spe is also specified, otherwise an error is issued. Default: NULL |
| format_new_vars | The function used to derive the reason(s) This function is used to derive the disposition reason(s) and must follow the below conventions <ul style="list-style-type: none"> • If only the main reason for discontinuation needs to be derived (i.e. new_var_spe is NULL), the function must have at least one character vector argument, e.g. <code>format_reason <- function(reason)</code> and new_var will be derived as <code>new_var = format_reason(reason_var)</code>. Typically, the content of the function would return reason_var or NA depending on the value (e.g. <code>if_else (reason != "COMPLETED" & !is.na(reason), reason, NA_character_)</code>). <code>DCSREAS = format_reason(DSDECOD)</code> returns <code>DCSREAS = DSDECOD</code> when <code>DSDECOD</code> is not 'COMPLETED' nor NA, NA otherwise. |

- If both the main reason and the details needs to be derived (new_var_spe is specified) the function must have two character vectors argument, e.g. `format_reason2 <- function(reason, reason_spe)` and new_var will be derived as `new_var = format_reason(reason_var)`, new_var_spe will be derived as `new_var_spe = format_reason(reason_var, reason_var_spe)`. Typically, the content of the function would return `reason_var_spe` or NA depending on the `reason_var` value (e.g. `if_else (reason == "OTHER", reason_spe, NA_character_)`). `DCSREASP = format_reason(DSDECOD, DSTERM)` returns `DCSREASP = DSTERM` when `DSDECOD` is equal to 'OTHER'.

Default: `format_reason_default`, see [format_reason_default\(\)](#) for details.

| | |
|---------------------------|--|
| <code>filter_ds</code> | Filter condition for the disposition data. Filter used to select the relevant disposition data. It is expected that the filter restricts <code>dataset_ds</code> such that there is at most one observation per patient. An error is issued otherwise. Permitted Values: logical expression. |
| <code>subject_keys</code> | Variables to uniquely identify a subject A list of quosures where the expressions are symbols as returned by <code>vars()</code> is expected. |

Details

This functions returns the main reason for discontinuation (e.g. `DCSREAS` or `DCTREAS`). The reason for discontinuation is derived based on `reason_var` (e.g. `DSDECOD`) and `format_new_vars`. If `new_var_spe` is not `NULL`, then the function will also return the details associated with the reason for discontinuation (e.g. `DCSREASP`). The details associated with the reason for discontinuation are derived based on `reason_var_spe` (e.g. `DSTERM`), `reason_var` and `format_new_vars`.

Value

the input dataset with the disposition reason(s) (`new_var` and if required `new_var_spe`) added.

    new_var_spe = DCSREASP,
    reason_var_spe = DSTERM,
    format_new_vars = format_dcsreas,
    filter_ds = DSCAT == "DISPOSITION EVENT"
  ) %>%
  select(STUDYID, USUBJID, DCSREAS, DCSREASP)

```

 derive_vars_dt

Derive/Impute a Date from a Date Character Vector

Description

Derive a date ('--DT') from a date character vector ('--DTC'). The date can be imputed (see `date_imputation` argument) and the date imputation flag ('--DTF') can be added.

Usage

```

derive_vars_dt(
  dataset,
  new_vars_prefix,
  dtc,
  highest_imputation = "n",
  date_imputation = "first",
  flag_imputation = "auto",
  min_dates = NULL,
  max_dates = NULL,
  preserve = FALSE
)

```

Arguments

| | |
|--------------------|--|
| dataset | Input dataset. The date character vector (dtc) must be present. |
| new_vars_prefix | Prefix used for the output variable(s). A character scalar is expected. For the date variable "DT" is appended to the specified prefix and for the date imputation flag "DTF". I.e., for new_vars_prefix = "AST" the variables ASTDT and ASTDTF are created. |
| dtc | The '--DTC' date to impute A character date is expected in a format like yyyy-mm-dd or yyyy-mm-ddThh:mm:ss. Trailing components can be omitted and - is a valid "missing" value for any component. |
| highest_imputation | Highest imputation level The highest_imputation argument controls which components of the DTC value are imputed if they are missing. All components up to the specified level are imputed. If a component at a higher level than the highest imputation level is missing, NA_character_ is returned. For example, for highest_imputation = "D" "2020" results in NA_character_ because the month is missing. If "n" is specified no imputation is performed, i.e., if any component is missing, NA_character_ is returned. If "Y" is specified, date_imputation should be "first" or "last" and min_dates or max_dates should be specified respectively. Otherwise, NA_character_ is returned if the year component is missing. <i>Default:</i> "n" <i>Permitted Values:</i> "Y" (year, highest level), "M" (month), "D" (day), "n" (none, lowest level) |
| date_imputation | The value to impute the day/month when a datepart is missing. A character value is expected, either as a <ul style="list-style-type: none"> • format with month and day specified as "mm-dd": e.g. "06-15" for the 15th of June (The year can not be specified; for imputing the year "first" or "last" together with min_dates or max_dates argument can be used (see examples).), • or as a keyword: "first", "mid", "last" to impute to the first/mid/last day/month. The argument is ignored if highest_imputation is less than "D". <i>Default:</i> "first" |
| flag_imputation | Whether the date imputation flag must also be derived. If "auto" is specified, the date imputation flag is derived if the date_imputation argument is not null. <i>Default:</i> "auto" <i>Permitted Values:</i> "auto", "date" or "none" |

| | |
|-----------|--|
| min_dates | <p>Minimum dates</p> <p>A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example</p> <pre>impute_dtc_dtm("2020-11", min_dates = list(ymd_hms("2020-12-06T12:12:12"), ymd_hms("2020-11-11T11:11:11")), highest_imputation = "M")</pre> <p>returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12" is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).</p> |
| max_dates | <p>Maximum dates</p> <p>A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.</p> |
| preserve | <p>Preserve day if month is missing and day is present</p> <p>For example "2019--07" would return "2019-06-07" if preserve = TRUE (and date_imputation = "MID").</p> <p>Permitted Values: TRUE, FALSE</p> <p>Default: FALSE</p> |

Details

In admiral we don't allow users to pick any single part of the date/time to impute, we only enable to impute up to a highest level, i.e. you couldn't choose to say impute months, but not days.

The presence of a '--DTF' variable is checked and if it already exists in the input dataset, a warning is issued and '--DTF' will be overwritten.

Value

The input dataset with the date '--DT' (and the date imputation flag '--DTF' if requested) added.

  mhdt,
  new_vars_prefix = "AST",
  dtc = MHSTDTC,
  highest_imputation = "M",
  date_imputation = "mid",
  preserve = TRUE
)

```

Description

Derive a datetime object ('--DTM') from a date character vector ('--DTC'). The date and time can be imputed (see `date_imputation/time_imputation` arguments) and the date/time imputation flag ('--DTF', '--TMF') can be added.

Usage

```
derive_vars_dtm(
  dataset,
  new_vars_prefix,
  dtc,
  highest_imputation = "h",
  date_imputation = "first",
  time_imputation = "first",
  flag_imputation = "auto",
  min_dates = NULL,
  max_dates = NULL,
  preserve = FALSE,
  ignore_seconds_flag = FALSE
)
```

Arguments

| | |
|---------------------------------|---|
| <code>dataset</code> | Input dataset The date character vector (<code>dtc</code>) must be present. |
| <code>new_vars_prefix</code> | Prefix used for the output variable(s). A character scalar is expected. For the date variable "DT" is appended to the specified prefix, for the date imputation flag "DTF", and for the time imputation flag "TMF". I.e., for <code>new_vars_prefix = "AST"</code> the variables ASTDT, ASTDTF, and ASTTMF are created. |
| <code>dtc</code> | The '--DTC' date to impute A character date is expected in a format like <code>yyyy-mm-dd</code> or <code>yyyy-mm-ddThh:mm:ss</code> . Trailing components can be omitted and <code>-</code> is a valid "missing" value for any component. |
| <code>highest_imputation</code> | Highest imputation level The <code>highest_imputation</code> argument controls which components of the DTC value are imputed if they are missing. All components up to the specified level are imputed. If a component at a higher level than the highest imputation level is missing, <code>NA_character_</code> is returned. For example, for <code>highest_imputation = "D"</code> <code>"2020"</code> results in <code>NA_character_</code> because the month is missing. If <code>"n"</code> is specified, no imputation is performed, i.e., if any component is missing, <code>NA_character_</code> is returned. |

If "Y" is specified, `date_imputation` should be "first" or "last" and `min_dates` or `max_dates` should be specified respectively. Otherwise, `NA_character_` is returned if the year component is missing.

Default: "h"

Permitted Values: "Y" (year, highest level), "M" (month), "D" (day), "h" (hour), "m" (minute), "s" (second), "n" (none, lowest level)

date_imputation

The value to impute the day/month when a datepart is missing.

A character value is expected, either as a

- format with month and day specified as "mm-dd": e.g. "06-15" for the 15th of June (The year can not be specified; for imputing the year "first" or "last" together with `min_dates` or `max_dates` argument can be used (see examples).),
- or as a keyword: "first", "mid", "last" to impute to the first/mid/last day/month.

The argument is ignored if `highest_imputation` is less than "D".

Default: "first".

time_imputation

The value to impute the time when a timepart is missing.

A character value is expected, either as a

- format with hour, min and sec specified as "hh:mm:ss": e.g. "00:00:00" for the start of the day,
- or as a keyword: "first", "last" to impute to the start/end of a day.

The argument is ignored if `highest_imputation` = "n".

Default: "first".

flag_imputation

Whether the date/time imputation flag(s) must also be derived.

If "auto" is specified, the date imputation flag is derived if the `date_imputation` argument is not null and the time imputation flag is derived if the `time_imputation` argument is not null

Default: "auto"

Permitted Values: "auto", "date", "time", "both", or "none"

min_dates

Minimum dates

A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the `dtc` value are considered. The possible dates are defined by the missing parts of the `dtc` date (see example below). This ensures that the non-missing parts of the `dtc` date are not changed. A date or date-time object is expected. For example

```
impute_dtc_dtm(
  "2020-11",
  min_dates = list(
    ymd_hms("2020-12-06T12:12:12"),
    ymd_hms("2020-11-11T11:11:11")
  )
)
```

```

    ),
    highest_imputation = "M"
  )

```

returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12" is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).

For date variables (not datetime) in the list the time is imputed to "00:00:00". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.

| | |
|---------------------|--|
| max_dates | <p>Maximum dates</p> <p>A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.</p> <p>For date variables (not datetime) in the list the time is imputed to "23:59:59". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.</p> |
| preserve | <p>Preserve day if month is missing and day is present</p> <p>For example "2019--07" would return "2019-06-07" if preserve = TRUE (and date_imputation = "mid").</p> <p>Permitted Values: TRUE, FALSE</p> <p><i>Default:</i> FALSE</p> |
| ignore_seconds_flag | <p>ADaM IG states that given SDTM ('--DTC') variable, if only hours and minutes are ever collected, and seconds are imputed in ('--DTM') as 00, then it is not necessary to set ('--TMF') to 'S'. A user can set this to TRUE so the 'S' Flag is dropped from ('--TMF').</p> <p>A logical value</p> <p><i>Default:</i> FALSE</p> |

Details

In admiral we don't allow users to pick any single part of the date/time to impute, we only enable to impute up to a highest level, i.e. you couldn't choose to say impute months, but not days.

The presence of a '--DTF' variable is checked and the variable is not derived if it already exists in the input dataset. However, if '--TMF' already exists in the input dataset, a warning is issued and '--TMF' will be overwritten.

Value

The input dataset with the datetime '--DTM' (and the date/time imputation flag '--DTF', '--TMF') added.

derive_vars_dtm_to_dt *Derive Date Variables from Datetime Variables*

Description

This function creates date(s) as output from datetime variable(s)

Usage

```
derive_vars_dtm_to_dt(dataset, source_vars)
```

Arguments

| | |
|-------------|--|
| dataset | Input dataset |
| source_vars | A list of datetime variables created using vars() from which dates are to be extracted |

Value

A data frame containing the input dataset with the corresponding date (--DT) variable(s) of all datetime variables (--DTM) specified in source_vars.

Author(s)

Teckla Akinyi

derive_vars_dtm_to_tm *Derive Time Variables from Datetime Variables*

Description

This function creates time variable(s) as output from datetime variable(s)

Usage

```
derive_vars_dtm_to_tm(dataset, source_vars)
```

Arguments

| | |
|-------------|--|
| dataset | Input dataset |
| source_vars | A list of datetime variables created using vars() from which time is to be extracted |

Details

The names of the newly added variables are automatically set by replacing the --DTM suffix of the source_vars with --TM. The --TM variables are created using the hms package.

Value

A data frame containing the input dataset with the corresponding time (--TM) variable(s) of all datetime variables (--DTM) specified in source_vars with the correct name.

Author(s)

Teckla Akinyi

 derive_vars_duration *Derive Duration*

Description

Derives duration between two dates, specified by the variables present in input dataset e.g., duration of adverse events, relative day, age, ...

Usage

```
derive_vars_duration(
  dataset,
  new_var,
  new_var_unit = NULL,
  start_date,
  end_date,
  in_unit = "days",
  out_unit = "days",
  floor_in = TRUE,
  add_one = TRUE,
  trunc_out = FALSE
)
```

Arguments

| | |
|--------------|---|
| dataset | Input dataset The variables specified by the start_date and the end_date parameter are expected. |
| new_var | Name of variable to create |
| new_var_unit | Name of the unit variable If the parameter is not specified, no variable for the unit is created. |
| start_date | The start date A date or date-time variable is expected. This variable must be present in specified input dataset. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. |
| end_date | The end date A date or date-time variable is expected. This variable must be present in specified input dataset. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. |
| in_unit | Input unit See floor_in and add_one parameter for details. Default: 'days' Permitted Values: 'years', 'months', 'days', 'hours', 'minutes', 'seconds' |

| | |
|-----------|---|
| out_unit | <p>Output unit</p> <p>The duration is derived in the specified unit</p> <p>Default: 'days'</p> <p>Permitted Values: 'years', 'months', 'days', 'hours', 'minutes', 'seconds'</p> |
| floor_in | <p>Round down input dates?</p> <p>The input dates are round down with respect to the input unit, e.g., if the input unit is 'days', the time of the input dates is ignored.</p> <p>Default: 'TRUE'</p> <p>Permitted Values: TRUE, FALSE</p> |
| add_one | <p>Add one input unit?</p> <p>If the duration is non-negative, one input unit is added. I.e., the duration can not be zero.</p> <p>Default: TRUE Permitted Values: TRUE, FALSE</p> |
| trunc_out | <p>Return integer part</p> <p>The fractional part of the duration (in output unit) is removed, i.e., the integer part is returned.</p> <p>Default: FALSE</p> <p>Permitted Values: TRUE, FALSE</p> |

Details

The duration is derived as time from start to end date in the specified output unit. If the end date is before the start date, the duration is negative. The start and end date variable must be present in the specified input dataset.

Value

The input dataset with the duration and unit variable added

```

derive_vars_dy *Derive Relative Day Variables*

Description

Adds relative day variables (--DY) to the dataset, e.g., ASTDY and AENDY.

Usage

```
derive_vars_dy(dataset, reference_date, source_vars)
```

Arguments

| | |
|----------------|---|
| dataset | Input dataset The columns specified by the reference_date and the source_vars parameter are expected. |
| reference_date | The start date column, e.g., date of first treatment A date or date-time object column is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. |
| source_vars | A list of datetime or date variables created using vars() from which dates are to be extracted. This can either be a list of date(time) variables or named --DY variables and corresponding -DT(M) variables e.g. vars(TRTSDTM, ASTDTM, AENDT) or vars(TRTSDT, ASTDTM, AENDT, DEATHDY = DTHDT). If the source variable does not end in -DT(M), a name for the resulting --DY variable must be provided. |

Details

The relative day is derived as number of days from the reference date to the end date. If it is nonnegative, one is added. I.e., the relative day of the reference date is 1. Unless a name is explicitly specified, the name of the resulting relative day variable is generated from the source variable name by replacing DT (or DTM as appropriate) with DY.

Value

The input dataset with --DY corresponding to the --DTM or --DT source variable(s) added

```

derive_vars_last_dose *Derive Last Dose*

Description

Add EX source variables from last dose to the input dataset.

Usage

```

derive_vars_last_dose(
  dataset,
  dataset_ex,
  filter_ex = NULL,

```

```

by_vars = vars(STUDYID, USUBJID),
dose_id = vars(),
dose_date,
analysis_date,
single_dose_condition = EXDOSFRQ == "ONCE",
new_vars = NULL,
traceability_vars = NULL
)

```

Arguments

| | |
|-----------------------|---|
| dataset | Input dataset. The variables specified by the <code>by_vars</code> and <code>analysis_date</code> parameters are expected. |
| dataset_ex | Input EX dataset. The variables specified by the <code>by_vars</code> , <code>dose_date</code> , <code>new_vars</code> parameters, and source variables from <code>traceability_vars</code> parameter are expected. |
| filter_ex | Filtering condition applied to EX dataset. For example, it can be used to filter for valid dose. Defaults to NULL. |
| by_vars | Variables to join by (created by <code>dplyr::vars</code>). |
| dose_id | Variables to identify unique dose (created by <code>dplyr::vars</code>). Defaults to empty <code>vars()</code> . |
| dose_date | The EX dose date variable. A date or date-time object is expected. |
| analysis_date | The analysis date variable. A date or date-time object is expected. |
| single_dose_condition | The condition for checking if <code>dataset_ex</code> is single dose. An error is issued if the condition is not true. Defaults to <code>(EXDOSFRQ == "ONCE")</code> . |
| new_vars | Variables to keep from <code>dataset_ex</code> , with the option to rename. Can either be variables created by <code>dplyr::vars</code> (e.g. <code>vars(VISIT)</code>), or named list returned by <code>vars()</code> (e.g. <code>vars(LSTEXVIS = VISIT)</code>). If set to NULL, then all variables from <code>dataset_ex</code> are kept without renaming. Defaults to NULL. |
| traceability_vars | A named list returned by <code>vars()</code> listing the traceability variables, e.g. <code>vars(LDOSEDOM = "EX", LDOSESEQ = EXSEQ)</code> . The left-hand side (names of the list elements) gives the names of the traceability variables in the returned dataset. The right-hand side (values of the list elements) gives the values of the traceability variables in the returned dataset. These can be either strings or symbols referring to existing variables. |

Details

When doing date comparison to identify last dose, date-time imputations are done as follows:

- `dose_date`: time is imputed to 00:00:00 if the variable is a date variable
- `analysis_date`: time is imputed to 23:59:59 if the variable is a date variable

The last dose records are identified as follows:

1. The dataset_ex is filtered using filter_ex, if provided. This is useful for, for example, filtering for valid dose only.
2. The datasets dataset and dataset_ex are joined using by_vars.
3. The last dose is identified: the last dose is the EX record with maximum date where dose_date is lower to or equal to analysis_date, subject to both date values are non-NA. The last dose is identified per by_vars. If multiple EX records exist for the same dose_date, then either dose_id needs to be supplied (e.g. dose_id = vars(EXSEQ)) to identify unique records, or an error is issued. When dose_id is supplied, the last EX record from the same dose_date sorted by dose_id will be used to identify last dose.
4. The EX source variables (as specified in new_vars) from last dose are appended to the dataset and returned to the user.

This function only works correctly for EX dataset with a structure of single dose per row. If your study EX dataset has multiple doses per row, use `create_single_dose_dataset()` to transform the EX dataset into single dose per row structure before calling `derive_vars_last_dose()`.

If variables (other than those specified in by_vars) exist in both dataset and dataset_ex, then join cannot be performed properly and an error is issued. To resolve the error, use new_vars to either keep variables unique to dataset_ex, or use this option to rename variables from dataset_ex (e.g. `new_vars = vars(LSTEXVIS = VISIT)`).

Value

Input dataset with EX source variables from last dose added.

```

| | |
|--------------------|---|
| derive_vars_merged | <i>Add New Variable(s) to the Input Dataset Based on Variables from Another Dataset</i> |
|--------------------|---|

Description

Add new variable(s) to the input dataset based on variables from another dataset. The observations to merge can be selected by a condition (`filter_add` argument) and/or selecting the first or last observation for each by group (`order` and `mode` argument).

Usage

```
derive_vars_merged(
```

```

dataset,
dataset_add,
by_vars,
order = NULL,
new_vars = NULL,
mode = NULL,
filter_add = NULL,
match_flag = NULL,
check_type = "warning",
duplicate_msg = NULL
)

```

Arguments

| | |
|-------------|---|
| dataset | Input dataset The variables specified by the by_vars parameter are expected. |
| dataset_add | Additional dataset The variables specified by the by_vars, the new_vars, and the order parameter are expected. |
| by_vars | Grouping variables The input dataset and the selected observations from the additional dataset are merged by the specified by variables. The by variables must be a unique key of the selected observations. <i>Permitted Values:</i> list of variables created by vars() |
| order | Sort order If the parameter is set to a non-null value, for each by group the first or last observation from the additional dataset is selected with respect to the specified order. <i>Default:</i> NULL <i>Permitted Values:</i> list of variables or desc(<variable>) function calls created by vars(), e.g., vars(ADT, desc(AVAL)) or NULL |
| new_vars | Variables to add The specified variables from the additional dataset are added to the output dataset. Variables can be renamed by naming the element, i.e., new_vars = vars(<new name> = <old name>). For example new_vars = vars(var1, var2) adds variables var1 and var2 from dataset_add to the input dataset. And new_vars = vars(var1, new_var2 = old_var2) takes var1 and old_var2 from dataset_add and adds them to the input dataset renaming old_var2 to new_var2. If the parameter is not specified or set to NULL, all variables from the additional dataset (dataset_add) are added. <i>Default:</i> NULL <i>Permitted Values:</i> list of variables created by vars() |
| mode | Selection mode Determines if the first or last observation is selected. If the order parameter is specified, mode must be non-null. |

| | |
|---------------|--|
| | <p>If the order parameter is not specified, the mode parameter is ignored.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> "first", "last", NULL</p> |
| filter_add | <p>Filter for additional dataset (dataset_add)</p> <p>Only observations fulfilling the specified condition are taken into account for merging. If the parameter is not specified, all observations are considered.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> a condition</p> |
| match_flag | <p>Match flag</p> <p>If the parameter is specified (e.g., match_flag = FLAG), the specified variable (e.g., FLAG) is added to the input dataset. This variable will be TRUE for all selected records from dataset_add which are merged into the input dataset, and NA otherwise.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> Variable name</p> |
| check_type | <p>Check uniqueness?</p> <p>If "warning" or "error" is specified, the specified message is issued if the observations of the (restricted) additional dataset are not unique with respect to the by variables and the order.</p> <p><i>Default:</i> "warning"</p> <p><i>Permitted Values:</i> "none", "warning", "error"</p> |
| duplicate_msg | <p>Message of unique check</p> <p>If the uniqueness check fails, the specified message is displayed.</p> <p><i>Default:</i></p> <pre>paste("Dataset `dataset_add` contains duplicate records with respect to", enumerate(vars2chr(by_vars)))</pre> |

Details

1. The records from the additional dataset (dataset_add) are restricted to those matching the filter_add condition.
2. If order is specified, for each by group the first or last observation (depending on mode) is selected.
3. The variables specified for new_vars are renamed (if requested) and merged to the input dataset using left_join(). I.e., the output dataset contains all observations from the input dataset. For observations without a matching observation in the additional dataset the new variables are set to NA. Observations in the additional dataset which have no matching observation in the input dataset are ignored.

Value

The output dataset contains all observations and variables of the input dataset and additionally the variables specified for new_vars from the additional dataset (dataset_add).

  mode = "last"  
)
```

derive_vars_merged_dt *Merge a (Imputed) Date Variable*

Description

[Deprecated]

This function is *deprecated*, please use `derive_vars_dt()` and `derive_vars_merged()` instead.

Merge a imputed date variable and date imputation flag from a dataset to the input dataset. The observations to merge can be selected by a condition and/or selecting the first or last observation for each by group.

Usage

```
derive_vars_merged_dt(  
  dataset,  
  dataset_add,  
  by_vars,  
  order = NULL,  
  new_vars_prefix,  
  filter_add = NULL,  
  mode = NULL,  
  dtc,  
  date_imputation = NULL,  
  flag_imputation = "auto",  
  min_dates = NULL,  
  max_dates = NULL,  
  preserve = FALSE,  
  check_type = "warning",  
  duplicate_msg = NULL  
)
```

Arguments

| | |
|-------------|--|
| dataset | Input dataset The variables specified by the <code>by_vars</code> parameter are expected. |
| dataset_add | Additional dataset The variables specified by the <code>by_vars</code> , the <code>dtc</code> , and the <code>order</code> parameter are expected. |
| by_vars | Grouping variables The input dataset and the selected observations from the additional dataset are merged by the specified by variables. The by variables must be a unique key of the selected observations. <i>Permitted Values:</i> list of variables created by <code>vars()</code> |

| | |
|-----------------|---|
| order | <p>Sort order</p> <p>If the parameter is set to a non-null value, for each by group the first or last observation from the additional dataset is selected with respect to the specified order. The imputed date variable can be specified as well (see examples below). Please note that NA is considered as the last value. I.e., if a order variable is NA and mode = "last", this observation is chosen while for mode = "first" the observation is chosen only if there are no observations where the variable is not 'NA'.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> list of variables or desc(<variable>) function calls created by vars(), e.g., vars(ADT, desc(AVAL)) or NULL</p> |
| new_vars_prefix | <p>Prefix used for the output variable(s).</p> <p>A character scalar is expected. For the date variable "DT" is appended to the specified prefix and for the date imputation flag "DTF". I.e., for new_vars_prefix = "AST" the variables ASTDT and ASTDTF are created.</p> |
| filter_add | <p>Filter for additional dataset (dataset_add)</p> <p>Only observations fulfilling the specified condition are taken into account for merging. If the parameter is not specified, all observations are considered.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> a condition</p> |
| mode | <p>Selection mode</p> <p>Determines if the first or last observation is selected. If the order parameter is specified, mode must be non-null.</p> <p>If the order parameter is not specified, the mode parameter is ignored.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> "first", "last", NULL</p> |
| dtc | <p>The '--DTC' date to impute</p> <p>A character date is expected in a format like yyyy-mm-dd or yyyy-mm-ddThh:mm:ss. Trailing components can be omitted and - is a valid "missing" value for any component.</p> |
| date_imputation | <p>The value to impute the day/month when a datepart is missing.</p> <p>A character value is expected, either as a</p> <ul style="list-style-type: none"> • format with month and day specified as "mm-dd": e.g. "06-15" for the 15th of June (The year can not be specified; for imputing the year "first" or "last" together with min_dates or max_dates argument can be used (see examples).), • or as a keyword: "first", "mid", "last" to impute to the first/mid/last day/month. <p>The argument is ignored if highest_imputation is less than "D".</p> <p><i>Default:</i> "first"</p> |
| flag_imputation | <p>Whether the date imputation flag must also be derived.</p> |

| | |
|---------------|--|
| | <p>If "auto" is specified, the date imputation flag is derived if the date_imputation argument is not null.</p> <p><i>Default:</i> "auto"</p> <p><i>Permitted Values:</i> "auto", "date" or "none"</p> |
| min_dates | <p>Minimum dates</p> <p>A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example</p> <pre>impute_dtc_dtm("2020-11", min_dates = list(ymd_hms("2020-12-06T12:12:12"), ymd_hms("2020-11-11T11:11:11")), highest_imputation = "M")</pre> <p>returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12" is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).</p> |
| max_dates | <p>Maximum dates</p> <p>A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.</p> |
| preserve | <p>Preserve day if month is missing and day is present</p> <p>For example "2019--07" would return "2019-06-07" if preserve = TRUE (and date_imputation = "MID").</p> <p><i>Permitted Values:</i> TRUE, FALSE</p> <p><i>Default:</i> FALSE</p> |
| check_type | <p>Check uniqueness?</p> <p>If "warning" or "error" is specified, the specified message is issued if the observations of the (restricted) additional dataset are not unique with respect to the by variables and the order.</p> <p><i>Default:</i> "warning"</p> <p><i>Permitted Values:</i> "none", "warning", "error"</p> |
| duplicate_msg | <p>Message of unique check</p> <p>If the uniqueness check fails, the specified message is displayed.</p> <p><i>Default:</i></p> <pre>paste("Dataset `dataset_add` contains duplicate records with respect to", enumerate(vars2chr(by_vars)))</pre> |

Details

1. The additional dataset is restricted to the observations matching the `filter_add` condition.
2. The date variable and if requested, the date imputation flag is added to the additional dataset.
3. If `order` is specified, for each by group the first or last observation (depending on mode) is selected.
4. The date and flag variables are merged to the input dataset.

Value

The output dataset contains all observations and variables of the input dataset and additionally the variable `<new_vars_prefix>DT` and optionally the variable `<new_vars_prefix>DTF` derived from the additional dataset (`dataset_add`).

derive_vars_merged_dtm

Merge a (Imputed) Datetime Variable

Description

[Deprecated]

This function is *deprecated*, please use `derive_vars_dtm()` and `derive_vars_merged()` instead.

Merge a imputed datetime variable, date imputation flag, and time imputation flag from a dataset to the input dataset. The observations to merge can be selected by a condition and/or selecting the first or last observation for each by group.

Usage

```
derive_vars_merged_dtm(  
  dataset,  
  dataset_add,  
  by_vars,  
  order = NULL,  
  new_vars_prefix,  
  filter_add = NULL,  
  mode = NULL,  
  dtc,  
  date_imputation = NULL,  
  time_imputation = "00:00:00",  
  flag_imputation = "auto",  
  min_dates = NULL,  
  max_dates = NULL,  
)
```

```

    preserve = FALSE,
    check_type = "warning",
    duplicate_msg = NULL
  )

```

Arguments

| | |
|-----------------|--|
| dataset | <p>Input dataset</p> <p>The variables specified by the <code>by_vars</code> parameter are expected.</p> |
| dataset_add | <p>Additional dataset</p> <p>The variables specified by the <code>by_vars</code>, the <code>dtc</code>, and the <code>order</code> parameter are expected.</p> |
| by_vars | <p>Grouping variables</p> <p>The input dataset and the selected observations from the additional dataset are merged by the specified by variables. The by variables must be a unique key of the selected observations.</p> <p><i>Permitted Values:</i> list of variables created by <code>vars()</code></p> |
| order | <p>Sort order</p> <p>If the parameter is set to a non-null value, for each by group the first or last observation from the additional dataset is selected with respect to the specified order. The imputed datetime variable can be specified as well (see examples below).</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> list of variables or <code>desc(<variable>)</code> function calls created by <code>vars()</code>, e.g., <code>vars(ADT, desc(AVAL))</code> or NULL</p> |
| new_vars_prefix | <p>Prefix used for the output variable(s).</p> <p>A character scalar is expected. For the date variable "DT" is appended to the specified prefix, for the date imputation flag "DTF", and for the time imputation flag "TMF". I.e., for <code>new_vars_prefix = "AST"</code> the variables <code>ASTDT</code>, <code>ASTDTF</code>, and <code>ASTTMF</code> are created.</p> |
| filter_add | <p>Filter for additional dataset (<code>dataset_add</code>)</p> <p>Only observations fulfilling the specified condition are taken into account for merging. If the parameter is not specified, all observations are considered.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> a condition</p> |
| mode | <p>Selection mode</p> <p>Determines if the first or last observation is selected. If the <code>order</code> parameter is specified, <code>mode</code> must be non-null.</p> <p>If the <code>order</code> parameter is not specified, the <code>mode</code> parameter is ignored.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> "first", "last", NULL</p> |
| dtc | <p>The '--DTC' date to impute</p> <p>A character date is expected in a format like <code>yyyy-mm-dd</code> or <code>yyyy-mm-ddThh:mm:ss</code>. Trailing components can be omitted and <code>-</code> is a valid "missing" value for any component.</p> |

date_imputation

The value to impute the day/month when a datepart is missing.

A character value is expected, either as a

- format with month and day specified as "mm-dd": e.g. "06-15" for the 15th of June (The year can not be specified; for imputing the year "first" or "last" together with min_dates or max_dates argument can be used (see examples).),
- or as a keyword: "first", "mid", "last" to impute to the first/mid/last day/month.

The argument is ignored if highest_imputation is less than "D".

Default: "first".

time_imputation

The value to impute the time when a timepart is missing.

A character value is expected, either as a

- format with hour, min and sec specified as "hh:mm:ss": e.g. "00:00:00" for the start of the day,
- or as a keyword: "first", "last" to impute to the start/end of a day.

The argument is ignored if highest_imputation = "n".

Default: "first".

flag_imputation

Whether the date/time imputation flag(s) must also be derived.

If "auto" is specified, the date imputation flag is derived if the date_imputation argument is not null and the time imputation flag is derived if the time_imputation argument is not null

Default: "auto"

Permitted Values: "auto", "date", "time", "both", or "none"

min_dates

Minimum dates

A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example

```
impute_dtc_dtm(
  "2020-11",
  min_dates = list(
    ymd_hms("2020-12-06T12:12:12"),
    ymd_hms("2020-11-11T11:11:11")
  ),
  highest_imputation = "M"
)
```

returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12"

| | |
|---------------|--|
| | is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date). |
| | For date variables (not datetime) in the list the time is imputed to "00:00:00". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result. |
| max_dates | <p>Maximum dates</p> <p>A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.</p> <p>For date variables (not datetime) in the list the time is imputed to "23:59:59". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.</p> |
| preserve | <p>Preserve day if month is missing and day is present</p> <p>For example "2019--07" would return "2019-06-07" if preserve = TRUE (and date_imputation = "mid").</p> <p>Permitted Values: TRUE, FALSE</p> <p>Default: FALSE</p> |
| check_type | <p>Check uniqueness?</p> <p>If "warning" or "error" is specified, the specified message is issued if the observations of the (restricted) additional dataset are not unique with respect to the by variables and the order.</p> <p>Default: "warning"</p> <p>Permitted Values: "none", "warning", "error"</p> |
| duplicate_msg | <p>Message of unique check</p> <p>If the uniqueness check fails, the specified message is displayed.</p> <p>Default:</p> <pre>paste("Dataset `dataset_add` contains duplicate records with respect to", enumerate(vars2chr(by_vars)))</pre> |

Details

1. The additional dataset is restricted to the observations matching the filter_add condition.
2. The datetime variable and if requested, the date imputation flag and time imputation flag is added to the additional dataset.
3. If order is specified, for each by group the first or last observation (depending on mode) is selected.
4. The date and flag variables are merged to the input dataset.

Value

The output dataset contains all observations and variables of the input dataset and additionally the variable <new_vars_prefix>DT and optionally the variables <new_vars_prefix>DTF and <new_vars_prefix>TMF derived from the additional dataset (dataset_add).

 derive_vars_merged_lookup

Merge Lookup Table with Source Dataset

Description

Merge user-defined lookup table with the input dataset. Optionally print a list of records from the input dataset that do not have corresponding mapping from the lookup table.

Usage

```
derive_vars_merged_lookup(
  dataset,
  dataset_add,
  by_vars,
  order = NULL,
  new_vars = NULL,
  mode = NULL,
  filter_add = NULL,
  check_type = "warning",
  duplicate_msg = NULL,
  print_not_mapped = TRUE
)
```

Arguments

| | |
|-------------|---|
| dataset | Input dataset The variables specified by the by_vars parameter are expected. |
| dataset_add | Lookup table The variables specified by the by_vars parameter are expected. |
| by_vars | Grouping variables The input dataset and the selected observations from the additional dataset are merged by the specified by variables. The by variables must be a unique key of the selected observations. <i>Permitted Values:</i> list of variables created by vars() |
| order | Sort order If the parameter is set to a non-null value, for each by group the first or last observation from the additional dataset is selected with respect to the specified order. <i>Default:</i> NULL <i>Permitted Values:</i> list of variables or desc(<variable>) function calls created by vars(), e.g., vars(ADT, desc(AVAL)) or NULL |

| | |
|------------------|--|
| new_vars | <p>Variables to add</p> <p>The specified variables from the additional dataset are added to the output dataset. Variables can be renamed by naming the element, i.e., <code>new_vars = vars(<new name> = <old name>)</code>. For example <code>new_vars = vars(var1, var2)</code> adds variables <code>var1</code> and <code>var2</code> from <code>dataset_add</code> to the input dataset. And <code>new_vars = vars(var1, new_var2 = old_var2)</code> takes <code>var1</code> and <code>old_var2</code> from <code>dataset_add</code> and adds them to the input dataset renaming <code>old_var2</code> to <code>new_var2</code>.</p> <p>If the parameter is not specified or set to <code>NULL</code>, all variables from the additional dataset (<code>dataset_add</code>) are added.</p> <p><i>Default:</i> <code>NULL</code></p> <p><i>Permitted Values:</i> list of variables created by <code>vars()</code></p> |
| mode | <p>Selection mode</p> <p>Determines if the first or last observation is selected. If the <code>order</code> parameter is specified, <code>mode</code> must be non-null. If the <code>order</code> parameter is not specified, the <code>mode</code> parameter is ignored.</p> <p><i>Default:</i> <code>NULL</code></p> <p><i>Permitted Values:</i> <code>"first"</code>, <code>"last"</code>, <code>NULL</code></p> |
| filter_add | <p>Filter for additional dataset (<code>dataset_add</code>)</p> <p>Only observations fulfilling the specified condition are taken into account for merging. If the parameter is not specified, all observations are considered.</p> <p><i>Default:</i> <code>NULL</code></p> <p><i>Permitted Values:</i> a condition</p> |
| check_type | <p>Check uniqueness?</p> <p>If <code>"warning"</code> or <code>"error"</code> is specified, the specified message is issued if the observations of the (restricted) additional dataset are not unique with respect to the <code>by</code> variables and the order.</p> <p><i>Default:</i> <code>"warning"</code></p> <p><i>Permitted Values:</i> <code>"none"</code>, <code>"warning"</code>, <code>"error"</code></p> |
| duplicate_msg | <p>Message of unique check</p> <p>If the uniqueness check fails, the specified message is displayed.</p> <p><i>Default:</i></p> <pre>paste("Dataset `dataset_add` contains duplicate records with respect to", enumerate(vars2chr(by_vars)))</pre> |
| print_not_mapped | <p>Print a list of unique <code>by_vars</code> values that do not have corresponding records from the lookup table?</p> <p><i>Default:</i> <code>TRUE</code></p> <p><i>Permitted Values:</i> <code>TRUE</code>, <code>FALSE</code></p> |

Value

The output dataset contains all observations and variables of the input dataset, and add the variables specified in `new_vars` from the lookup table specified in `dataset_add`. Optionally prints a list of unique `by_vars` values that do not have corresponding records from the lookup table (by specifying `print_not_mapped = TRUE`).

)
```

 derive_vars_query

Derive Query Variables

Description

Derive Query Variables

Usage

```
derive_vars_query(dataset, dataset_queries)
```

Arguments

`dataset` Input dataset.

`dataset_queries` A dataset containing required columns `VAR_PREFIX`, `QUERY_NAME`, `TERM_LEVEL`, `TERM_NAME`, `TERM_ID`, and optional columns `QUERY_ID`, `QUERY_SCOPE`, `QUERY_SCOPE_NUM`. The content of the dataset will be verified by [assert_valid_queries\(\)](#). `create_query_data()` can be used to create the dataset.

Details

This function can be used to derive CDISC variables such as `SMQzzNAM`, `SMQzzCD`, `SMQzzSC`, `SMQzzSCN`, and `CQzzNAM` in `ADAE` and `ADMH`, and variables such as `SDGzzNAM`, `SDGzzCD`, and `SDGzzSC` in `ADCM`. An example usage of this function can be found in the [OCCDS vignette](#).

A query dataset is expected as an input to this function. See the [Queries Dataset Documentation vignette](#) for descriptions, or call `data("queries")` for an example of a query dataset.

For each unique element in `VAR_PREFIX`, the corresponding "NAM" variable will be created. For each unique `VAR_PREFIX`, if `QUERY_ID` is not "" or NA, then the corresponding "CD" variable is created; similarly, if `QUERY_SCOPE` is not "" or NA, then the corresponding "SC" variable will be created; if `QUERY_SCOPE_NUM` is not "" or NA, then the corresponding "SCN" variable will be created.

For each record in `dataset`, the "NAM" variable takes the value of `QUERY_NAME` if the value of `TERM_NAME` or `TERM_ID` in `dataset_queries` matches the value of the respective `TERM_LEVEL` in `dataset`. Note that `TERM_NAME` in `dataset_queries` dataset may be NA only when `TERM_ID` is non-NA and vice versa. The "CD", "SC", and "SCN" variables are derived accordingly based on `QUERY_ID`, `QUERY_SCOPE`, and `QUERY_SCOPE_NUM` respectively, whenever not missing.

Value

The input dataset with query variables derived.

derive_vars_suppqual *Join Supplementary Qualifier Variables into the Parent SDTM Domain*

Description

[Deprecated]

Deprecated, please use `metatools::combine_supp()` instead.

The SDTM does not allow any new variables beside ones assigned to each SDTM domain. So, Supplemental Qualifier is introduced to supplement each SDTM domain to contain non standard variables. `dataset_suppqual` can be either a single SUPPQUAL dataset or separate supplementary data sets (SUPP) such as SUPPDM, SUPPAE, and SUPPEX. When a `dataset_suppqual` is a single SUPPQUAL dataset, specify two characterdomain value.

`derive_vars_suppqual()` expects USUBJID, RDOMAIN, IDVAR, IDVARVAL, QNAM, QLABEL, and QVAL variables to exist in `dataset_suppqual`.

Usage

```
derive_vars_suppqual(dataset, dataset_suppqual, domain = NULL)
```

Arguments

| | |
|-------------------------------|---|
| <code>dataset</code> | A SDTM domain data set. |
| <code>dataset_suppqual</code> | A Supplemental Qualifier (SUPPQUAL) data set. |
| <code>domain</code> | Two letter domain value. Used when supplemental data set is common across multiple SDTM domain. |

Value

A data frame with SUPPQUAL variables appended to parent data set.

Author(s)

Vignesh Thanikachalam

`derive_vars_transposed`*Derive Variables by Transposing and Merging a Second Dataset*

Description

Adds variables from a vertical dataset after transposing it into a wide one.

Usage

```
derive_vars_transposed(  
  dataset,  
  dataset_merge,  
  by_vars,  
  key_var,  
  value_var,  
  filter = NULL  
)
```

Arguments

| | |
|----------------------------|---|
| <code>dataset</code> | Input dataset The variables specified by the <code>by_vars</code> parameter are required |
| <code>dataset_merge</code> | Dataset to transpose and merge The variables specified by the <code>by_vars</code> , <code>key_var</code> and <code>value_var</code> parameters are expected |
| <code>by_vars</code> | Keys used to merge <code>dataset_merge</code> with <code>dataset</code> |
| <code>key_var</code> | The variable of <code>dataset_merge</code> containing the names of the transposed variables |
| <code>value_var</code> | The variable of <code>dataset_merge</code> containing the values of the transposed variables |
| <code>filter</code> | Expression used to restrict the records of <code>dataset_merge</code> prior to transposing |

Details

After filtering `dataset_merge` based upon the condition provided in `filter`, this dataset is transposed and subsequently merged onto `dataset` using `by_vars` as keys.

Value

The input dataset with transposed variables from `dataset_merge` added

|----------------|----------------------------------|
| derive_var_ady | <i>Derive Analysis Study Day</i> |
|----------------|----------------------------------|

Description

[Deprecated]

This function is *deprecated*, please use `derive_vars_dy()` instead.

Adds the analysis study day (ADY) to the dataset, i.e., study day of analysis date.

Usage

```
derive_var_ady(dataset, reference_date = TRTSDT, date = ADT)
```

Arguments

| | |
|----------------|--|
| dataset | Input dataset The columns specified by the <code>reference_date</code> and the <code>date</code> parameter are expected. |
| reference_date | The start date column, e.g., date of first treatment A date or date-time object column is expected. Refer to <code>derive_vars_dt()</code> to impute and derive a date from a date character vector to a date object. The default is TRTSDT. |
| date | The end date column for which the study day should be derived A date or date-time object column is expected. Refer to <code>derive_vars_dt()</code> to impute and derive a date from a date character vector to a date object. The default is ADT |

Details

The study day is derived as number of days from the start date to the end date. If it is non-negative, one is added. I.e., the study day of the start date is 1.

Value

The input dataset with ADY column added

Author(s)

Stefan Bundfuss

derive_var_aendy *Derive Analysis End Relative Day*

Description

[Deprecated]

This function is *deprecated*, please use `derive_vars_dy()` instead.

Adds the analysis end relative day (AENDY) to the dataset, i.e. study day of analysis end date

Usage

```
derive_var_aendy(dataset, reference_date = TRTSDT, date = AENDT)
```

Arguments

| | |
|----------------|--|
| dataset | Input dataset The columns specified by the <code>reference_date</code> and the <code>date</code> parameter are expected. |
| reference_date | The start date column, e.g., date of first treatment A date or date-time object column is expected. Refer to <code>derive_vars_dt()</code> to impute and derive a date from a date character vector to a date object. The default is TRTSDT. |
| date | The end date column for which the study day should be derived A date or date-time object column is expected. Refer to <code>derive_vars_dt()</code> to impute and derive a date from a date character vector to a date object. The default is AENDT |

Details

The study day is derived as number of days from the start date to the end date. If it is nonnegative, one is added. I.e., the study day of the start date is 1.

Value

The input dataset with AENDY column added

derive_var_agegr_fda *Derive Age Groups*

Description**[Deprecated]**

These functions are *deprecated*.

Usage

```
derive_var_agegr_fda(dataset, age_var, age_unit = NULL, new_var)
```

```
derive_var_agegr_ema(dataset, age_var, age_unit = NULL, new_var)
```

Arguments

| | |
|----------|---------------------------------------|
| dataset | Input dataset |
| age_var | AGE variable |
| age_unit | AGE unit variable |
| new_var | New variable to create inside dataset |

Author(s)

Ondrej Slama

derive_var_age_years *Derive Age in Years*

Description

Derive Age in Years

Usage

```
derive_var_age_years(dataset, age_var, age_unit = NULL, new_var)
```

Arguments

| | |
|---------|----------------|
| dataset | Input dataset. |
| age_var | AGE variable. |

| | |
|-----------------------|---|
| <code>age_unit</code> | AGE unit variable. The AGE unit variable is used to convert AGE to 'years' so that grouping can occur. This is only used when the <code>age_var</code> variable does not have a corresponding unit in the dataset. Default: NULL Permitted Values: 'years', 'months', 'weeks', 'days', 'hours', 'minutes', 'seconds' |
| <code>new_var</code> | New AGE variable to be created in years. |

Details

This function is used to convert age variables into years. These can then be used to create age groups.

Value

The input dataset with `new_var` parameter added in years.

Author(s)

Michael Thorpe

Examples

```
library(dplyr, warn.conflicts = FALSE)

data <- data.frame(
  AGE = c(27, 24, 3, 4, 1),
  AGEU = c("days", "months", "years", "weeks", "years")
)

data %>%
  derive_var_age_years(., AGE, new_var = AAGE)

data.frame(AGE = c(12, 24, 36, 48)) %>%
  derive_var_age_years(., AGE, age_unit = "months", new_var = AAGE)
```

`derive_var_analysis_ratio`*Derive Ratio Variable*

Description

Derives a ratio variable for a BDS dataset based on user specified variables.

Usage

```
derive_var_analysis_ratio(dataset, numer_var, denom_var, new_var = NULL)
```

Arguments

| | |
|------------------------|--|
| <code>dataset</code> | Input dataset |
| <code>numer_var</code> | Variable containing numeric values to be used in the numerator of the ratio calculation. |
| <code>denom_var</code> | Variable containing numeric values to be used in the denominator of the ratio calculation. |
| <code>new_var</code> | A user-defined variable that will be appended to the dataset. The default behavior will take the denominator variable and prefix it with R2 and append to the dataset. Using this argument will override this default behavior. Default is NULL. |

Details

A user wishing to calculate a Ratio to Baseline, AVAL / BASE will have returned a new variable R2BASE that will be appended to the input dataset. Ratio to Analysis Range Lower Limit AVAL / ANRLO will return a new variable R2ANRLO, and Ratio to Analysis Range Upper Limit AVAL / ANRHI will return a new variable R2ANRLO. Please note how the denominator variable has the prefix R2----. A user can override the default returned variables by using the `new_var` argument. Also, values of 0 in the denominator will return NA in the derivation.

```

derive_var_anrind *Derive Reference Range Indicator*

Description

Derive Reference Range Indicator

Usage

```
derive_var_anrind(dataset)
```

Arguments

dataset The input dataset

Details

ANRIND is set to

- "NORMAL" if AVAL is greater or equal ANRLO and less than or equal ANRHI; or if AVAL is greater than or equal ANRLO and ANRHI is missing; or if AVAL is less than or equal ANRHI and ANRLO is missing
- "LOW" if AVAL is less than ANRLO and either A1LO is missing or AVAL is greater than or equal A1LO

- "HIGH" if AVAL is greater than ANRHI and either A1HI is missing or AVAL is less than or equal A1HI
- "LOW LOW" if AVAL is less than A1LO
- "HIGH HIGH" if AVAL is greater than A1HI

Value

The input dataset with additional column ANRIND

```

derive_var_astdy

Derive Analysis Start Relative Day

Description

[Deprecated]

This function is *deprecated*, please use `derive_vars_dy()` instead.

Adds the analysis start relative day (ASTDY) to the dataset, i.e., study day of analysis start date.

Usage

```
derive_var_astdy(dataset, reference_date = TRTSDT, date = ASTDT)
```

Arguments

| | |
|----------------|---|
| dataset | Input dataset The columns specified by the reference_date and the date parameter are expected. |
| reference_date | The start date column, e.g., date of first treatment A date or date-time object column is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. The default is TRTSDT. |
| date | The end date column for which the study day should be derived A date or date-time object column is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. The default is ASTDT |

Details

The study day is derived as number of days from the start date to the end date. If it is nonnegative, one is added. I.e., the study day of the start date is 1.

Value

The input dataset with ASTDY column added

Author(s)

Stefan Bundfuss

derive_var_atirel *Derive Time Relative to Reference*

Description**[Deprecated]**

This function is *deprecated*, as it is deemed as too specific for admiral. Derivations like this can be implemented calling mutate() and case_when().

Derives the variable ATIREL to CONCOMITANT, PRIOR, PRIOR_CONCOMITANT or NULL based on the relationship of cm Analysis start/end date/times to treatment start date/time

Usage

```
derive_var_atirel(dataset, flag_var, new_var)
```

Arguments

| | |
|----------|--|
| dataset | Input dataset The variables TRTSDTM, ASTDTM, AENDTM are expected |
| flag_var | Name of the variable with Analysis Start Date Imputation Flag |
| new_var | Name of variable to create |

Details

ATIREL is set to:

- null, if Datetime of First Exposure to Treatment is missing,
- "CONCOMITANT", if the Analysis Start Date/Time is greater than or equal to Datetime of First Exposure to Treatment,
- "PRIOR", if the Analysis End Date/Time is not missing and less than the Datetime of First Exposure to Treatment,
- "CONCOMITANT" if the date part of Analysis Start Date/Time is equal to the date part of Datetime of First Exposure to Treatment and the Analysis Start Time Imputation Flag is 'H' or 'M',
- otherwise it is set to "PRIOR_CONCOMITANT".

Value

A dataset containing all observations and variables of the input dataset and additionally the variable specified by the new_var parameter.

Author(s)

Teckla Akinyi

derive_var_atoxgr *Derive Lab High toxicity Grade 0 - 4 and Low Toxicity Grades 0 - (-4)*

Description

Derives character lab grade based on high and low severity/toxicity grade(s).

Usage

```
derive_var_atoxgr(
  dataset,
  lotox_description_var = ATOXDSCS,
  hitox_description_var = ATOXDSCS
)
```

Arguments

| | |
|-----------------------|---|
| dataset | Input data set The columns ATOXGRL, ATOXGRH and specified by lotox_description_var, and hitox_description_var parameters are expected. |
| lotox_description_var | Variable containing the toxicity grade description for low values, eg. "Anemia" |
| hitox_description_var | Variable containing the toxicity grade description for low values, eg. "Hemoglobin Increased". |

Details

Created variable ATOXGR will contain values "-4", "-3", "-2", "-1" for low values and "1", "2", "3", "4" for high values, and will contain "0" if value is gradable and does not satisfy any of the criteria for high or low values. ATOXGR is set to missing if information not available to give a grade.

Function applies the following rules:

- High and low missing - overall missing
- Low grade not missing and > 0 - overall holds low grade
- High grade not missing and > 0 - overall holds high grade
- (Only high direction OR low direction is NORMAL) and high grade normal - overall NORMAL
- (Only low direction OR high direction is NORMAL) and low grade normal - overall NORMAL
- otherwise set to missing

Value

The input data set with the character variable added

Author(s)

Gordon Miller

  "Hypoglycemia", "Hyperglycemia", NA_character_, "0",
```

```

    "Hypoglycemia",      "Hyperglycemia",    "0",      "1",
    "Hypoglycemia",      "Hyperglycemia",    "0",      "0",
    NA_character_,       "INR Increased",    NA_character_, "0",
    "Hypophosphatemia", NA_character_,       "1",      NA_character_
  )

  derive_var_atoxgr(adlb)

```

derive_var_atoxgr_dir *Derive Lab Toxicity Grade 0 - 4*

Description

Derives a character lab grade based on severity/toxicity criteria.

Usage

```

derive_var_atoxgr_dir(
  dataset,
  new_var,
  tox_description_var,
  meta_criteria = atoxgr_criteria_ctcv4,
  criteria_direction,
  get_unit_expr
)

```

Arguments

| | |
|---------------------|--|
| dataset | Input data set The columns specified by tox_description_var parameter is expected. |
| new_var | Name of the character grade variable to create, for example, ATOXGRH or ATOXGRL. |
| tox_description_var | Variable containing the description of the grading criteria. For example: "Anemia" or "INR Increased". |
| meta_criteria | Metadata data set holding the criteria (normally a case statement) Default: atoxgr_criteria_ctcv4 admiral metadata data set atoxgr_criteria_ctcv4 implements Common Terminology Criteria for Adverse Events (CTCAE) v4.0 The metadata should have the following variables: <ul style="list-style-type: none"> • TERM: variable to hold the term describing the criteria applied to a particular lab test, eg. "Anemia" or "INR Increased". Note: the variable is case insensitive. • DIRECTION: variable to hold the direction of the abnormality of a particular lab test value. "L" is for LOW values, "H" is for HIGH values. Note: the variable is case insensitive. |

- SI_UNIT_CHECK: variable to hold unit of particular lab test. Used to check against input data if criteria is based on absolute values.
- VAR_CHECK: variable to hold comma separated list of variables used in criteria. Used to check against input data that variables exist.
- GRADE_CRITERIA_CODE: variable to hold code that creates grade based on defined criteria.

criteria_direction

Direction (L= Low, H = High) of toxicity grade.

Permitted Values: "L", "H"

get_unit_expr An expression providing the unit of the parameter

The result is used to check the units of the input parameters. Compared with SI_UNIT_CHECK in metadata (see meta_criteria parameter).

Permitted Values: A variable containing unit from the input dataset, or a function call, for example, get_unit_expr = extract_unit(PARAM).

Details

new_var is derived with values NA, "0", "1", "2", "3", "4", where "4" is the most severe grade

- "4" is where the lab value satisfies the criteria for grade 4.
- "3" is where the lab value satisfies the criteria for grade 3.
- "2" is where the lab value satisfies the criteria for grade 2.
- "1" is where the lab value satisfies the criteria for grade 1.
- "0" is where a grade can be derived and is not grade "1", "2", "3" or "4".
- NA is where a grade cannot be derived.

Value

The input dataset with the character variable added

Author(s)

Gordon Miller

)

```

derive_var_base *Derive Baseline Variables*

Description

Derive baseline variables, e.g. BASE or BNRIND, in a BDS dataset

Usage

```

derive_var_base(
  dataset,
  by_vars,
  source_var = AVAL,
  new_var = BASE,
  filter = ABLFL == "Y"
)

```

Arguments

| | |
|------------|---|
| dataset | The input dataset |
| by_vars | Grouping variables uniquely identifying a set of records for which to calculate new_var |
| source_var | The column from which to extract the baseline value, e.g. AVAL |
| new_var | The name of the newly created baseline column, e.g. BASE |
| filter | The condition used to filter dataset for baseline records. By default ABLFL == "Y" |

Details

For each by_vars group the baseline record is identified by filtering using the condition specified by filter which defaults to ABLFL == "Y". Subsequently, every value of the new_var variable for the by_vars group is set to the value of the source_var variable of the baseline record. In case there are multiple baseline records within by_vars an error is issued.

Value

A new data.frame containing all records and variables of the input dataset plus the new_var variable

Author(s)

Thomas Neitmann

}

```

derive_var_basetype *Derive BASETYPE Variable*

Description

Baseline Type BASETYPE is needed when there is more than one definition of baseline for a given Analysis Parameter PARAM in the same dataset. For a given parameter, if Baseline Value BASE is populated, and there is more than one definition of baseline, then BASETYPE must be non-null on all records of any type for that parameter. Each value of BASETYPE refers to a definition of baseline that characterizes the value of BASE on that row. Please see section 4.2.1.6 of the ADaM Implementation Guide, version 1.3 for further background.

Usage

```
derive_var_basetype(dataset, basetypes)
```

Arguments

| | |
|-----------|--|
| dataset | Input dataset The columns specified in the expressions inside basetypes are required. |
| basetypes | A <i>named</i> list of expressions created using the <code>rlang::exprs()</code> function The names corresponds to the values of the newly created BASETYPE variables and the expressions are used to subset the input dataset. |

Details

Adds the BASETYPE variable to a dataset and duplicates records based upon the provided conditions.

For each element of basetypes the input dataset is subset based upon the provided expression and the BASETYPE variable is set to the name of the expression. Then, all subsets are stacked. Records which do not match any condition are kept and BASETYPE is set to NA.

Value

The input dataset with variable BASETYPE added

 derive_var_chg

Derive Change from Baseline

Description

Derive change from baseline (CHG) in a BDS dataset

Usage

```
derive_var_chg(dataset)
```

Arguments

dataset The input dataset. Required variables are AVAL and BASE.

Details

Change from baseline is calculated by subtracting the baseline value from the analysis value.

Value

The input dataset with an additional column named CHG

)
derive_var_chg(advs)
```

```
derive_var_confirmation_flag
      Derive Confirmation Flag
```

Description

Derive a flag which depends on other observations of the dataset. For example, flagging events which need to be confirmed by a second event.

Usage

```
derive_var_confirmation_flag(
  dataset,
  by_vars,
  order,
  new_var,
  join_vars,
  join_type,
  first_cond = NULL,
  filter,
  true_value = "Y",
  false_value = NA_character_,
  check_type = "warning"
)
```

Arguments

`dataset` Input dataset
 The variables specified by the `by_vars` and `join_vars` parameter are expected.

| | |
|------------|---|
| by_vars | <p>By variables</p> <p>The specified variables are used as by variables for joining the input dataset with itself.</p> |
| order | <p>Order</p> <p>The observations are ordered by the specified order.</p> |
| new_var | <p>New variable</p> <p>The specified variable is added to the input dataset.</p> |
| join_vars | <p>Variables to keep from joined dataset</p> <p>The variables needed from the other observations should be specified for this parameter. The specified variables are added to the joined dataset with suffix ".join". For example to flag all observations with AVALC == "Y" and AVALC == "Y" for at least one subsequent visit join_vars = vars(AVALC, AVISITN) and filter = AVALC == "Y" & AVALC.join == "Y" & AVISITN < AVISITN.join could be specified.</p> <p>The *.join variables are not included in the output dataset.</p> |
| join_type | <p>Observations to keep after joining</p> <p>The argument determines which of the joined observations are kept with respect to the original observation. For example, if join_type = "after" is specified all observations after the original observations are kept.</p> <p>For example for confirmed response or BOR in the oncology setting or confirmed deterioration in questionnaires the confirmatory assessment must be after the assessment to be flagged. Thus join_type = "after" could be used.</p> <p>Whereas, sometimes you might allow for confirmatory observations to occur prior to the observation to be flagged. For example, to flag AEs occurring on or after seven days before a COVID AE. Thus join_type = "all" could be used.</p> <p><i>Permitted Values:</i> "before", "after", "all"</p> |
| first_cond | <p>Condition for selecting range of data</p> <p>If this argument is specified, the other observations are restricted up to the first observation where the specified condition is fulfilled. If the condition is not fulfilled for any of the other observations, no observations are considered, i.e., the observation is not flagged.</p> <p>This parameter should be specified if filter contains summary functions which should not apply to all observations but only up to the confirmation assessment. For an example see the third example below.</p> |
| filter | <p>Condition for selecting observations</p> <p>The filter is applied to the joined dataset for flagging the confirmed observations. The condition can include summary functions. The joined dataset is grouped by the original observations. I.e., the summary function are applied to all observations up to the confirmation observation. For example, filter = AVALC == "CR" & all(AVALC.join %in% c("CR", "NE")) & count_vals(var = AVALC.join, val = "NE") <= 1 selects observations with response "CR" and for all observations up to the confirmation observation the response is "CR" or "NE" and there is at most one "NE".</p> |
| true_value | <p>Value of new_var for flagged observations</p> <p><i>Default:</i> "Y"</p> |

| | |
|-------------|--|
| false_value | Value of new_var for observations not flagged <i>Default:</i> NA_character_ |
| check_type | Check uniqueness? If "warning" or "error" is specified, the specified message is issued if the observations of the input dataset are not unique with respect to the by variables and the order. <i>Default:</i> "warning" <i>Permitted Values:</i> "none", "warning", "error" |

Details

An example usage might be flagging if a patient received two required medications within a certain timeframe of each other.

In the oncology setting, for example, the function could be used to flag if a response value can be confirmed by an other assessment. This is commonly used in endpoints such as best overall response.

The following steps are performed to produce the output dataset.

Step 1:

The input dataset is joined with itself by the variables specified for by_vars. From the right hand side of the join only the variables specified for join_vars are kept. The suffix ".join" is added to these variables.

For example, for by_vars = USUBJID, join_vars = vars(AVISITN, AVALC) and input dataset

```
# A tibble: 2 x 4
  USUBJID AVISITN AVALC  AVAL
<chr>    <dbl> <chr> <dbl>
1         1 Y      1
1         2 N      0
```

the joined dataset is

```
A tibble: 4 x 6
  USUBJID AVISITN AVALC  AVAL AVISITN.join AVALC.join
<chr>    <dbl> <chr> <dbl> <dbl> <chr>
1         1 Y      1         1 Y
1         1 Y      1         2 N
1         2 N      0         1 Y
1         2 N      0         2 N
```

Step 2:

The joined dataset is restricted to observations with respect to join_type and order.

The dataset from the example in the previous step with join_type = "after" and order = vars(AVISITN) is restricted to

```
A tibble: 4 x 6
  USUBJID AVISITN AVALC  AVAL AVISITN.join AVALC.join
<chr>    <dbl> <chr> <dbl> <dbl> <chr>
1         1 Y      1         2 N
```

Step 3:

If `first_cond` is specified, for each observation of the input dataset the joined dataset is restricted to observations up to the first observation where `first_cond` is fulfilled (the observation fulfilling the condition is included). If for an observation of the input dataset the condition is not fulfilled, the observation is removed.

Step 4:

The joined dataset is grouped by the observations from the input dataset and restricted to the observations fulfilling the condition specified by `filter`.

Step 5:

The first observation of each group is selected

Step 6:

The variable specified by `new_var` is added to the input dataset. It is set to `true_value` for all observations which were selected in the previous step. For the other observations it is set to `false_value`.

Value

The input dataset with the variable specified by `new_var` added.

derive_var_disposition_status

Derive a Disposition Status at a Specific Timepoint

Description

Derive a disposition status from the the relevant records in the disposition domain.

Usage

```

derive_var_disposition_status(
  dataset,
  dataset_ds,
  new_var,
  status_var,
  format_new_var = format_eoxxstt_default,
  filter_ds,
  subject_keys = vars(STUDYID, USUBJID)
)

```

Arguments

| | |
|----------------|--|
| dataset | Input dataset. |
| dataset_ds | Dataset containing the disposition information (e.g.: ds). It must contain: <ul style="list-style-type: none"> • STUDYID, USUBJID, • The variable(s) specified in the status_var • The variables used in filter_ds. |
| new_var | Name of the disposition status variable. A variable name is expected (e.g. EOSSTT). |
| status_var | The variable used to derive the disposition status. A variable name is expected (e.g. DSDECOD). |
| format_new_var | The format used to derive the status. Default: format_eoxxstt_default() defined as: <pre> format_eoxxstt_default <- function(status) { case_when(status %in% c("SCREEN FAILURE", "SCREENING NOT COMPLETED") ~ "NOT STARTED", status == "COMPLETED" ~ "COMPLETED", !status %in% c("COMPLETED", "SCREEN FAILURE", "SCREENING NOT COMPLETED")) } </pre> |

```

      & !is.na(status) ~ "DISCONTINUED",
      TRUE ~ "ONGOING"
    )
  }

```

where status is the status_var .

filter_ds Filter condition for the disposition data.
one observation per patient. An error is issued otherwise.
Permitted Values: logical expression.

subject_keys Variables to uniquely identify a subject
A list of quosures where the expressions are symbols as returned by vars() is expected.

Value

The input dataset with the disposition status (new_var) added. new_var is derived based on the values given in status_var and according to the format defined by format_new_var (e.g. when the default format is used, the function will derive new_var as: "NOT STARTED" if status is "SCREEN FAILURE" or "SCREENING NOT COMPLETED", "COMPLETED" if status_var == "COMPLETED", "DISCONTINUED" if status is not in ("COMPLETED","SCREEN FAILURE", "SCREENING NOT COMPLETED") nor NA, "ONGOING" otherwise).

```

derive_var_dthcaus *Derive Death Cause*

Description

Derive death cause (DTHCAUS) and add traceability variables if required.

Usage

```

derive_var_dthcaus(
  dataset,
  ...,
  source_datasets,
  subject_keys = vars(STUDYID, USUBJID)
)

dthcaus_source(

```

```

    dataset_name,
    filter,
    date,
    order = NULL,
    mode = "first",
    dthcaus,
    traceability_vars = NULL
)

```

Arguments

| | |
|-------------------|---|
| dataset | Input dataset. The variables specified by <code>subject_keys</code> are required. |
| ... | Objects of class "dthcaus_source" created by <code>dthcaus_source()</code> . |
| source_datasets | A named list containing datasets in which to search for the death cause |
| subject_keys | Variables to uniquely identify a subject A list of quosures where the expressions are symbols as returned by <code>vars()</code> is expected. |
| dataset_name | The name of the dataset, i.e. a string, used to search for the death cause. |
| filter | An expression used for filtering dataset. |
| date | A date or datetime variable to be used for sorting dataset. |
| order | Sort order Additional variables to be used for sorting the dataset which is ordered by the date and order. Can be used to avoid duplicate record warning. <i>Default:</i> NULL <i>Permitted Values:</i> list of variables or <code>desc(<variable>)</code> function calls created by <code>vars()</code> , e.g., <code>vars(ADT, desc(AVAL))</code> or NULL |
| mode | One of "first" or "last". Either the "first" or "last" observation is preserved from the dataset which is ordered by date. |
| dthcaus | A variable name or a string literal — if a variable name, e.g., AEDECOD, it is the variable in the source dataset to be used to assign values to DTHCAUS; if a string literal, e.g. "Adverse Event", it is the fixed value to be assigned to DTHCAUS. |
| traceability_vars | A named list returned by <code>vars()</code> listing the traceability variables, e.g. <code>vars(DTHDOM = "DS", DTHSEQ = DSSEQ)</code> . The left-hand side (names of the list elements) gives the names of the traceability variables in the returned dataset. The right-hand side (values of the list elements) gives the values of the traceability variables in the returned dataset. These can be either strings or symbols referring to existing variables. |

Details

This function derives DTHCAUS along with the user-defined traceability variables, if required. If a subject has death info from multiple sources, the one from the source with the earliest death date will be used. If dates are equivalent, the first source will be kept, so the user should provide the inputs in the preferred order.

Value

derive_var_dthcaus() returns the input dataset with DTHCAUS variable added.

dthcaus_source() returns an object of class "dthcaus_source".

Functions

- dthcaus_source: Create objects of class "dthcaus_source"

```

derive_var_extreme_dt *Derive First or Last Date from Multiple Sources*

Description

Add the first or last date from multiple sources to the dataset, e.g., the last known alive date (LSTALVDT).

Usage

```

derive_var_extreme_dt(
  dataset,
  new_var,
  ...,
  source_datasets,
  mode,
  subject_keys = vars(STUDYID, USUBJID)
)

```

Arguments

| | |
|-----------------|--|
| dataset | Input dataset |
| | The variables specified by subject_keys are required. |
| new_var | Name of variable to create |
| ... | Source(s) of dates. One or more date_source() objects are expected. |
| source_datasets | A named list containing datasets in which to search for the first or last date |

| | |
|--------------|--|
| mode | Selection mode (first or last) If "first" is specified, the first date for each subject is selected. If "last" is specified, the last date for each subject is selected. Permitted Values: "first", "last" |
| subject_keys | Variables to uniquely identify a subject A list of quosures where the expressions are symbols as returned by vars() is expected. |

Details

The following steps are performed to create the output dataset:

1. For each source dataset the observations as specified by the `filter` element are selected and observations where date is NA are removed. Then for each patient the first or last observation (with respect to date and mode) is selected.
2. The new variable is set to the variable specified by the `date` element.
3. The variables specified by the `traceability_vars` element are added.
4. The selected observations of all source datasets are combined into a single dataset.
5. For each patient the first or last observation (with respect to the new variable and mode) from the single dataset is selected and the new variable is merged to the input dataset.
6. The time part is removed from the new variable.

Value

The input dataset with the new variable added.

 derive_var_extreme_dtm

Derive First or Last Datetime from Multiple Sources

Description

Add the first or last datetime from multiple sources to the dataset, e.g., the last known alive datetime (LSTALVDTM).

Usage

```
derive_var_extreme_dtm(
  dataset,
  new_var,
  ...,
  source_datasets,
  mode,
  subject_keys = vars(STUDYID, USUBJID)
)
```

Arguments

| | |
|-----------------|--|
| dataset | Input dataset The variables specified by subject_keys are required. |
| new_var | Name of variable to create |
| ... | Source(s) of dates. One or more date_source() objects are expected. |
| source_datasets | A named list containing datasets in which to search for the first or last date |
| mode | Selection mode (first or last) If "first" is specified, the first date for each subject is selected. If "last" is specified, the last date for each subject is selected. Permitted Values: "first", "last" |
| subject_keys | Variables to uniquely identify a subject A list of quosures where the expressions are symbols as returned by vars() is expected. |

Details

The following steps are performed to create the output dataset:

1. For each source dataset the observations as specified by the filter element are selected and observations where date is NA are removed. Then for each patient the first or last observation (with respect to date and mode) is selected.
2. The new variable is set to the variable specified by the date element. If this is a date variable (rather than datetime), then the time is imputed as "00:00:00".
3. The variables specified by the traceability_vars element are added.
4. The selected observations of all source datasets are combined into a single dataset.
5. For each patient the first or last observation (with respect to the new variable and mode) from the single dataset is selected and the new variable is merged to the input dataset.

Value

The input dataset with the new variable added.

derive_var_extreme_flag

Add a Variable Flagging the First or Last Observation Within Each By Group

Description

Add a variable flagging the first or last observation within each by group

Usage

```

derive_var_extreme_flag(
  dataset,
  by_vars,
  order,
  new_var,
  mode,
  filter = deprecated(),
  check_type = "warning"
)

```

Arguments

| | |
|---------|--|
| dataset | Input dataset |
| | The variables specified by the by_vars parameter are expected. |
| by_vars | Grouping variables |
| | Permitted Values: list of variables |

| | |
|------------|--|
| order | Sort order The first or last observation is determined with respect to the specified order. Permitted Values: list of variables or functions of variables |
| new_var | Variable to add The specified variable is added to the output dataset. It is set to "Y" for the first or last observation (depending on the mode) of each by group. Permitted Values: list of name-value pairs |
| mode | Flag mode Determines of the first or last observation is flagged. Permitted Values: "first", "last" |
| filter | Deprecated, please use restrict_derivation() instead (see examples). |
| check_type | Check uniqueness? If "warning" or "error" is specified, the specified message is issued if the observations of the input dataset are not unique with respect to the by variables and the order. Default: "warning" Permitted Values: "none", "warning", "error" |

Details

For each group (with respect to the variables specified for the `by_vars` parameter), `new_var` is set to "Y" for the first or last observation (with respect to the order specified for the `order` parameter and the flag mode specified for the `mode` parameter). Only observations included by the `filter` parameter are considered for flagging. Otherwise, `new_var` is set to NA. Thus, the direction of "worst" is considered fixed for all parameters in the dataset depending on the order and the mode, i.e. for every parameter the first or last record will be flagged across the whole dataset.

Value

The input dataset with the new flag variable added

derive_var_last_dose_amt
```

Derive Last Dose Amount

Description

Add a variable for dose amount from the last dose to the input dataset.

Usage

```

derive_var_last_dose_amt(
  dataset,
  dataset_ex,
  filter_ex = NULL,
  by_vars = vars(STUDYID, USUBJID),
  dose_id = vars(),
  dose_date,
  analysis_date,
  single_dose_condition = (EXDOSFRQ == "ONCE"),
  new_var,
  dose_var = EXDOSE,
  traceability_vars = NULL
)

```

Arguments

| | |
|-----------------------|---|
| dataset | Input dataset. The variables specified by the <code>by_vars</code> and <code>analysis_date</code> parameters are expected. |
| dataset_ex | Input EX dataset. The variables specified by the <code>by_vars</code> , <code>dose_date</code> , <code>new_vars</code> parameters, and source variables from <code>traceability_vars</code> parameter are expected. |
| filter_ex | Filtering condition applied to EX dataset. For example, it can be used to filter for valid dose. Defaults to NULL. |
| by_vars | Variables to join by (created by <code>dplyr::vars</code>). |
| dose_id | Variables to identify unique dose (created by <code>dplyr::vars</code>). Defaults to empty <code>vars()</code> . |
| dose_date | The EX dose date variable. A date or date-time object is expected. |
| analysis_date | The analysis date variable. A date or date-time object is expected. |
| single_dose_condition | The condition for checking if <code>dataset_ex</code> is single dose. An error is issued if the condition is not true. Defaults to <code>(EXDOSFRQ == "ONCE")</code> . |
| new_var | The new variable added to dataset. |
| dose_var | The EX source dose amount variable. Defaults to <code>EXDOSE</code> . |
| traceability_vars | A named list returned by <code>vars()</code> listing the traceability variables, e.g. <code>vars(LDOSEDOM = "EX", LDOSESEQ = EXSEQ)</code> . The left-hand side (names of the list elements) gives the names of the traceability variables in the returned dataset. The right-hand side (values of the list elements) gives the values of the traceability variables in the returned dataset. These can be either strings or symbols referring to existing variables. |

Details

The last dose amount is derived as the dose amount where the maximum `dose_date` is lower to or equal to the `analysis_date` per `by_vars` for each observation in dataset.

If dose information is aggregated (i.e. is a dosing frequency other than "ONCE" over a period defined by a start and end date) the function `create_single_dose_dataset()` can be used to generate single doses from aggregate dose information and satisfy `single_dose_condition`.

Value

Input dataset with additional column `new_var`.

select(STUDYID, USUBJID, AESEQ, AESTDTC, LDOSEDOM, LDOSESEQ, LDOSEVAR, LDOSE)

```

derive_var_last_dose_date

Derive Last Dose Date-Time

Description

Add a variable for the dose date or datetime of the last dose to the input dataset.

Usage

```

derive_var_last_dose_date(
  dataset,
  dataset_ex,
  filter_ex = NULL,
  by_vars = vars(STUDYID, USUBJID),
  dose_id = vars(),
  dose_date,
  analysis_date,
  single_dose_condition = (EXDOSFRQ == "ONCE"),
  new_var,
  output_datetime = TRUE,
  traceability_vars = NULL
)

```

Arguments

| | |
|------------|---|
| dataset | Input dataset. The variables specified by the <code>by_vars</code> and <code>analysis_date</code> parameters are expected. |
| dataset_ex | Input EX dataset. The variables specified by the <code>by_vars</code> , <code>dose_date</code> , <code>new_vars</code> parameters, and source variables from <code>traceability_vars</code> parameter are expected. |
| filter_ex | Filtering condition applied to EX dataset. For example, it can be used to filter for valid dose. Defaults to NULL. |
| by_vars | Variables to join by (created by <code>dplyr::vars</code>). |
| dose_id | Variables to identify unique dose (created by <code>dplyr::vars</code>). Defaults to empty <code>vars()</code> . |
| dose_date | The EX dose date variable. A date or date-time object is expected. |

| | |
|-----------------------|---|
| analysis_date | The analysis date variable. A date or date-time object is expected. |
| single_dose_condition | The condition for checking if dataset_ex is single dose. An error is issued if the condition is not true. Defaults to (EXDOSFRQ == "ONCE"). |
| new_var | The new date or datetime variable added to dataset. |
| output_datetime | Display new_var as datetime or as date only. Defaults to TRUE. |
| traceability_vars | A named list returned by <code>vars()</code> listing the traceability variables, e.g. <code>vars(LDOSEDOM = "EX", LDOSESEQ = EXSEQ)</code> . The left-hand side (names of the list elements) gives the names of the traceability variables in the returned dataset. The right-hand side (values of the list elements) gives the values of the traceability variables in the returned dataset. These can be either strings or symbols referring to existing variables. |

Details

The last dose date is derived as the maximum dose date where the dose_date is lower to or equal to the analysis_date per by_vars for each observation in dataset. When output_datetime is TRUE and time is missing, then the last dose date time is imputed to 00:00:00. However, if date is missing, then no imputation is done.

If dose information is aggregated (i.e. is a dosing frequency other than "ONCE" over a period defined by a start and end date) the function `create_single_dose_dataset()` can be used to generate single doses from aggregate dose information and satisfy single_dose_condition.

Value

Input dataset with additional column new_var.

Derive Last Dose with User-Defined Groupings

Description

Add a variable for user-defined dose grouping of the last dose to the input dataset.

Usage

```

derive_var_last_dose_grp(
  dataset,
  dataset_ex,
  filter_ex = NULL,
  by_vars = vars(STUDYID, USUBJID),
  dose_id = vars(),
  dose_date,
  analysis_date,
  single_dose_condition = (EXDOSFRQ == "ONCE"),
  new_var,
  grp_brks,

```

```

    grp_lbls,
    include_lowest = TRUE,
    right = TRUE,
    dose_var = EXDOSE,
    traceability_vars = NULL
)

```

Arguments

| | |
|-----------------------|---|
| dataset | Input dataset. The variables specified by the <code>by_vars</code> and <code>analysis_date</code> parameters are expected. |
| dataset_ex | Input EX dataset. The variables specified by the <code>by_vars</code> , <code>dose_date</code> , <code>new_vars</code> parameters, and source variables from <code>traceability_vars</code> parameter are expected. |
| filter_ex | Filtering condition applied to EX dataset. For example, it can be used to filter for valid dose. Defaults to <code>NULL</code> . |
| by_vars | Variables to join by (created by <code>dplyr::vars</code>). |
| dose_id | Variables to identify unique dose (created by <code>dplyr::vars</code>). Defaults to empty <code>vars()</code> . |
| dose_date | The EX dose date variable. A date or date-time object is expected. |
| analysis_date | The analysis date variable. A date or date-time object is expected. |
| single_dose_condition | The condition for checking if <code>dataset_ex</code> is single dose. An error is issued if the condition is not true. Defaults to <code>(EXDOSFRQ == "ONCE")</code> . |
| new_var | The output variable defined by the user. |
| grp_brks | User supplied breaks to apply to groups. Refer to <code>breaks</code> parameter in <code>cut()</code> for details. |
| grp_lbls | User supplied labels to apply to groups. Refer to <code>labels</code> parameter in <code>cut()</code> for details. |
| include_lowest | logical, indicating if a value equal to the lowest (or highest, for <code>right = FALSE</code>) 'breaks' value should be included. Refer to <code>include.lowest</code> parameter in <code>cut()</code> for details. |
| right | Logical, indicating if the intervals should be closed on the right (and open on the left) or vice versa. Refer to <code>right</code> parameter in <code>cut()</code> for details. |
| dose_var | The source dose amount variable. Defaults to <code>EXDOSE</code> . |
| traceability_vars | A named list returned by <code>vars()</code> listing the traceability variables, e.g. <code>vars(LDOSEDOM = "EX", LDOSESEQ = EXSEQ)</code> . The left-hand side (names of the list elements) gives the names of the traceability variables in the returned dataset. The right-hand side (values of the list elements) gives the values of the traceability variables in the returned dataset. These can be either strings or symbols referring to existing variables. |

Details

Last dose is the dose with maximum dose_date that is lower to or equal to the analysis_date per by_vars for each observation in dataset. The last dose group is then derived by user-defined grouping, which groups dose_var as specified in grp_brks, and returns grp_lbls as the values for new_var.

If dose information is aggregated (i.e. is a dosing frequency other than "ONCE" over a period defined by a start and end date) the function create_single_dose_dataset() can be used to generate single doses from aggregate dose information and satisfy single_dose_condition.

Value

Input dataset with additional column new_var.

derive_var_merged_cat *Merge a Categorization Variable*

Description

Merge a categorization variable from a dataset to the input dataset. The observations to merge can be selected by a condition and/or selecting the first or last observation for each by group.

Usage

```

derive_var_merged_cat(
  dataset,
  dataset_add,
  by_vars,
  order = NULL,
  new_var,
  source_var,
  cat_fun,
  filter_add = NULL,
  mode = NULL,
  missing_value = NA_character_
)

```

Arguments

| | |
|-------------|---|
| dataset | Input dataset The variables specified by the by_vars parameter are expected. |
| dataset_add | Additional dataset The variables specified by the by_vars, the source_var, and the order parameter are expected. |

| | |
|---------------|--|
| by_vars | <p>Grouping variables</p> <p>The input dataset and the selected observations from the additional dataset are merged by the specified by variables. The by variables must be a unique key of the selected observations.</p> <p><i>Permitted Values:</i> list of variables created by vars()</p> |
| order | <p>Sort order</p> <p>If the parameter is set to a non-null value, for each by group the first or last observation from the additional dataset is selected with respect to the specified order.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> list of variables or desc(<variable>) function calls created by vars(), e.g., vars(ADT, desc(AVAL)) or NULL</p> |
| new_var | <p>New variable</p> <p>The specified variable is added to the additional dataset and set to the categorized values, i.e., cat_fun(<source variable>).</p> |
| source_var | Source variable |
| cat_fun | <p>Categorization function</p> <p>A function must be specified for this parameter which expects the values of the source variable as input and returns the categorized values.</p> |
| filter_add | <p>Filter for additional dataset (dataset_add)</p> <p>Only observations fulfilling the specified condition are taken into account for merging. If the parameter is not specified, all observations are considered.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> a condition</p> |
| mode | <p>Selection mode</p> <p>Determines if the first or last observation is selected. If the order parameter is specified, mode must be non-null.</p> <p>If the order parameter is not specified, the mode parameter is ignored.</p> <p><i>Default:</i> NULL</p> <p><i>Permitted Values:</i> "first", "last", NULL</p> |
| missing_value | <p>Values used for missing information</p> <p>The new variable is set to the specified value for all by groups without observations in the additional dataset.</p> <p><i>Default:</i> NA_character_</p> |

Details

1. The additional dataset is restricted to the observations matching the filter_add condition.
2. The categorization variable is added to the additional dataset.
3. If order is specified, for each by group the first or last observation (depending on mode) is selected.
4. The categorization variable is merged to the input dataset.

Value

The output dataset contains all observations and variables of the input dataset and additionally the variable specified for `new_var` derived from the additional dataset (`dataset_add`).

```

derive_var_merged_character

Merge a Character Variable

Description

Merge a character variable from a dataset to the input dataset. The observations to merge can be selected by a condition and/or selecting the first or last observation for each by group.

Usage

```

derive_var_merged_character(
  dataset,
  dataset_add,
  by_vars,
  order = NULL,
  new_var,
  source_var,
  case = NULL,
  filter_add = NULL,
  mode = NULL,
  missing_value = NA_character_
)

```

Arguments

| | |
|-------------|--|
| dataset | Input dataset The variables specified by the <code>by_vars</code> parameter are expected. |
| dataset_add | Additional dataset The variables specified by the <code>by_vars</code> , the <code>source_var</code> , and the <code>order</code> parameter are expected. |
| by_vars | Grouping variables The input dataset and the selected observations from the additional dataset are merged by the specified by variables. The by variables must be a unique key of the selected observations. <i>Permitted Values:</i> list of variables created by <code>vars()</code> |

| | |
|---------------|---|
| order | Sort order If the parameter is set to a non-null value, for each by group the first or last observation from the additional dataset is selected with respect to the specified order. <i>Default:</i> NULL <i>Permitted Values:</i> list of variables or desc(<variable>) function calls created by vars(), e.g., vars(ADT, desc(AVAL)) or NULL |
| new_var | New variable The specified variable is added to the additional dataset and set to the transformed value with respect to the case parameter. |
| source_var | Source variable |
| case | Change case Changes the case of the values of the new variable. <i>Default:</i> NULL <i>Permitted Values:</i> NULL, "lower", "upper", "title" |
| filter_add | Filter for additional dataset (dataset_add) Only observations fulfilling the specified condition are taken into account for merging. If the parameter is not specified, all observations are considered. <i>Default:</i> NULL <i>Permitted Values:</i> a condition |
| mode | Selection mode Determines if the first or last observation is selected. If the order parameter is specified, mode must be non-null. If the order parameter is not specified, the mode parameter is ignored. <i>Default:</i> NULL <i>Permitted Values:</i> "first", "last", NULL |
| missing_value | Values used for missing information The new variable is set to the specified value for all by groups without observations in the additional dataset. <i>Default:</i> NA_character_ <i>Permitted Value:</i> A character scalar |

Details

1. The additional dataset is restricted to the observations matching the filter_add condition.
2. The (transformed) character variable is added to the additional dataset.
3. If order is specified, for each by group the first or last observation (depending on mode) is selected.
4. The character variable is merged to the input dataset.

Value

The output dataset contains all observations and variables of the input dataset and additionally the variable specified for new_var derived from the additional dataset (dataset_add).

library(dplyr, warn.conflicts = FALSE)
data("admiral_dm")
data("admiral_ds")

derive_var_merged_character(
  admiral_dm,
  dataset_add = admiral_ds,
  by_vars = vars(STUDYID, USUBJID),
  new_var = DISPSTAT,
  filter_add = DSCAT == "DISPOSITION EVENT",
  source_var = DSDECOD,
  case = "title"
) %>%
  select(STUDYID, USUBJID, AGE, AGEU, DISPSTAT)
```

derive_var_merged_exist_flag

Merge an Existence Flag

Description

Adds a flag variable to the input dataset which indicates if there exists at least one observation in another dataset fulfilling a certain condition.

Usage

```
derive_var_merged_exist_flag(
  dataset,
  dataset_add,
  by_vars,
  new_var,
  condition,
  true_value = "Y",
  false_value = NA_character_,
```

```

    missing_value = NA_character_,
    filter_add = NULL
)

```

Arguments

| | |
|---------------|--|
| dataset | Input dataset The variables specified by the <code>by_vars</code> parameter are expected. |
| dataset_add | Additional dataset The variables specified by the <code>by_vars</code> parameter are expected. |
| by_vars | Grouping variables <i>Permitted Values:</i> list of variables |
| new_var | New variable The specified variable is added to the input dataset. |
| condition | Condition The condition is evaluated at the additional dataset (<code>dataset_add</code>). For all by groups where it evaluates as TRUE at least once the new variable is set to the true value (<code>true_value</code>). For all by groups where it evaluates as FALSE or NA for all observations the new variable is set to the false value (<code>false_value</code>). The new variable is set to the missing value (<code>missing_value</code>) for by groups not present in the additional dataset. |
| true_value | True value <i>Default:</i> "Y" |
| false_value | False value <i>Default:</i> NA_character_ |
| missing_value | Values used for missing information The new variable is set to the specified value for all by groups without observations in the additional dataset. <i>Default:</i> NA_character_ <i>Permitted Value:</i> A character scalar |
| filter_add | Filter for additional data Only observations fulfilling the specified condition are taken into account for flagging. If the parameter is not specified, all observations are considered. <i>Permitted Values:</i> a condition |

Details

1. The additional dataset is restricted to the observations matching the `filter_add` condition.
2. The new variable is added to the input dataset and set to the true value (`true_value`) if for the by group at least one observation exists in the (restricted) additional dataset where the condition evaluates to TRUE. It is set to the false value (`false_value`) if for the by group at least one observation exists and for all observations the condition evaluates to FALSE or NA. Otherwise, it is set to the missing value (`missing_value`).

Value

The output dataset contains all observations and variables of the input dataset and additionally the variable specified for `new_var` derived from the additional dataset (`dataset_add`).

derive_var_obs_number *Adds a Variable Numbering the Observations Within Each By Group*

Description

Adds a variable numbering the observations within each by group

Usage

```
derive_var_obs_number(
  dataset,
  by_vars = NULL,
  order = NULL,
  new_var = ASEQ,
  check_type = "none"
)
```

Arguments

| | |
|------------|---|
| dataset | Input dataset The variables specified by the order and the by_vars parameter are expected. |
| by_vars | Grouping variables Permitted Values: list of variables |
| order | Sort order Within each by group the observations are ordered by the specified order. Permitted Values: list of variables or functions of variables |
| new_var | Name of variable to create The new variable is set to the observation number for each by group. The numbering starts with 1. Default: ASEQ |
| check_type | Check uniqueness? If "warning" or "error" is specified, the specified message is issued if the observations of the input dataset are not unique with respect to the by variables and the order. Default: "none" Permitted Values: "none", "warning", "error" |

Details

For each group (with respect to the variables specified for the by_vars parameter) the first or last observation (with respect to the order specified for the order parameter and the mode specified for the mode parameter) is included in the output dataset.

Value

A dataset containing all observations and variables of the input dataset and additionally the variable specified by the `new_var` parameter.

    order = vars(VISITNUM, VSTPTNUM)
  )
```

derive_var_ontrtfl

Derive On-Treatment Flag Variable

Description

Derive on-treatment flag (ONTRTFL) in an ADaM dataset with a single assessment date (e.g ADT) or event start and end dates (e.g. ASTDT/AENDT).

Usage

```
derive_var_ontrtfl(
  dataset,
  new_var = ONTRTFL,
  start_date,
  end_date = NULL,
  ref_start_date,
  ref_end_date = NULL,
  ref_end_window = 0,
```

```

    filter_pre_timepoint = NULL,
    span_period = NULL
)

```

Arguments

| | |
|----------------------|--|
| dataset | Input dataset. Required columns are start_date, end_date, ref_start_date and ref_end_date. |
| new_var | On-treatment flag variable name to be created. Default is ONTRTFL. |
| start_date | The start date (e.g. AESDT) or assessment date (e.g. ADT) Required; A date or date-time object column is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. |
| end_date | The end date of assessment/event (e.g. AENDT) A date or date-time object column is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. Optional; Default is null. If the used and date value is missing on an observation, it is assumed the medication is ongoing and ONTRTFL is set to "Y". |
| ref_start_date | The lower bound of the on-treatment period Required; A date or date-time object column is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. |
| ref_end_date | The upper bound of the on-treatment period A date or date-time object column is expected. Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. Optional; This can be null and everything after ref_start_date will be considered on-treatment. Default is NULL. |
| ref_end_window | A window to add to the upper bound ref_end_date measured in days (e.g. 7 if 7 days should be added to the upper bound) Optional; default is 0. |
| filter_pre_timepoint | An expression to filter observations as not on-treatment when date = ref_start_date. For example, if observations where VSTPT = PRE should not be considered on-treatment when date = ref_start_date, filter_pre_timepoint should be used to denote when the on-treatment flag should be set to null. Optional; default is NULL. |
| span_period | A "Y" scalar character. If "Y", events that started prior to the ref_start_date and are ongoing or end after the ref_start_date are flagged as "Y". Optional; default is NULL. |

Details

On-Treatment is calculated by determining whether the assessment date or start/stop dates fall between 2 dates. The following logic is used to assign on-treatment = "Y":

1. start_date is missing and ref_start_date is non-missing
2. No timepoint filter is provided (filter_pre_timepoint) and both start_date and ref_start_date are non-missing and start_date = ref_start_date
3. A timepoint is provided (filter_pre_timepoint) and both start_date and ref_start_date are non-missing and start_date = ref_start_date and the filter provided in filter_pre_timepoint is not true.
4. ref_end_date is not provided and ref_start_date < start_date
5. ref_end_date is provided and ref_start_date < start_date <= ref_end_date + ref_end_window.

If the end_date is provided and the end_date < ref_start_date then the ONTRTFL is set to NULL. This would be applicable to cases where the start_date is missing and ONTRTFL has been assigned as "Y" above.

If the span_period is specified as "Y", this allows the user to assign ONTRTFL as "Y" to cases where the record started prior to the ref_start_date and was ongoing or ended after the ref_start_date.

Any date imputations needed should be done prior to calling this function.

Value

The input dataset with an additional column named ONTRTFL with a value of "Y" or NA

| | |
|-----------------|--|
| derive_var_pchg | <i>Derive Percent Change from Baseline</i> |
|-----------------|--|

Description

Derive percent change from baseline (PCHG) in a BDS dataset

Usage

```
derive_var_pchg(dataset)
```

Arguments

dataset The input dataset. Required variables are AVAL and BASE.

Details

Percent change from baseline is calculated by dividing change from baseline by the absolute value of the baseline value and multiplying the result by 100.

Value

The input dataset with an additional column named PCHG

| | |
|------------------|---------------------|
| derive_var_shift | <i>Derive Shift</i> |
|------------------|---------------------|

Description

Derives a character shift variable containing concatenated shift in values based on user-defined pairing, e.g., shift from baseline to analysis value, shift from baseline grade to analysis grade, ...

Usage

```
derive_var_shift(
  dataset,
  new_var,
  from_var,
  to_var,
  na_val = "NULL",
  sep_val = " to "
)
```

Arguments

| | |
|----------|--|
| dataset | Input dataset The columns specified by from_var and the to_var parameters are expected. |
| new_var | Name of the character shift variable to create. |
| from_var | Variable containing value to shift from. |
| to_var | Variable containing value to shift to. |
| na_val | Character string to replace missing values in from_var or to_var. Default: "NULL" |
| sep_val | Character string to concatenate values of from_var and to_var. Default: " to " |

Details

new_var is derived by concatenating the values of from_var to values of to_var (e.g. "NORMAL to HIGH"). When from_var or to_var has missing value, the missing value is replaced by na_val (e.g. "NORMAL to NULL").

Value

The input dataset with the character shift variable added

      to_var = ANRIND
    ),
    filter = is.na(ABLFL)
  )
```

derive_var_trtdurd *Derive Total Treatment Duration (Days)*

Description

Derives total treatment duration (days) (TRTDURD)

Usage

```
derive_var_trtdurd(dataset, start_date = TRTSDDT, end_date = TRTEDT)
```

Arguments

| | |
|------------|--|
| dataset | Input dataset The columns specified by the start_date and the end_date parameter are expected. |
| start_date | The start date A date or date-time object is expected. Refer to <code>derive_vars_dt()</code> to impute and derive a date from a date character vector to a date object. Default: TRTSDDT |
| end_date | The end date A date or date-time object is expected. Refer to <code>derive_vars_dt()</code> to impute and derive a date from a date character vector to a date object. Default: TRTEDT |

Details

The total treatment duration is derived as the number of days from start to end date plus one.

Value

The input dataset with TRTDURD added

```

`derive_var_worst_flag` *Adds a Variable Flagging the Maximal / Minimal Value Within a Group of Observations*

Description

Adds a Variable Flagging the Maximal / Minimal Value Within a Group of Observations

Usage

```
derive_var_worst_flag(
  dataset,
  by_vars,
  order,
  new_var,
  param_var,
  analysis_var,
  worst_high,
  worst_low,
  filter = deprecated(),
  check_type = "warning"
)
```

Arguments

| | |
|---------------------------|--|
| <code>dataset</code> | Input dataset. Variables specified by <code>by_vars</code> , <code>order</code> , <code>param_var</code> , and <code>analysis_var</code> are expected. |
| <code>by_vars</code> | Grouping variables Permitted Values: list of variables |
| <code>order</code> | Sort order. Used to determine maximal / minimal observation if they are not unique, see Details section for more information. |
| <code>new_var</code> | Variable to add to the dataset. It is set "Y" for the maximal / minimal observation of each group, see Details section for more information. |
| <code>param_var</code> | Variable with the parameter values for which the maximal / minimal value is calculated. |
| <code>analysis_var</code> | Variable with the measurement values for which the maximal / minimal value is calculated. |

| | |
|------------|--|
| worst_high | Character with param_var values specifying the parameters referring to "high". Use character(0) if not required. |
| worst_low | Character with param_var values specifying the parameters referring to "low". Use character(0) if not required. |
| filter | Deprecated, please use restrict_derivation() instead (see examples). |
| check_type | Check uniqueness? If "warning" or "error" is specified, the specified message is issued if the observations of the input dataset are not unique with respect to the by variables and the order. Default: "warning" Permitted Values: "none", "warning", "error" |

Details

For each group with respect to the variables specified by the by_vars parameter, the maximal / minimal observation of analysis_var is labelled in the new_var column as "Y", if its param_var is in worst_high / worst_low. Otherwise, it is assigned NA. If there is more than one such maximal / minimal observation, the first one with respect to the order specified by the order parameter is flagged. The direction of "worst" depends on the definition of worst for a specified parameters in the arguments worst_high / worst_low, i.e. for some parameters the highest value is the worst and for others the worst is the lowest value.

Value

The input dataset with the new flag variable added.

| | |
|------------------|-------------------------------------|
| dose_freq_lookup | <i>Pre-Defined Dose Frequencies</i> |
|------------------|-------------------------------------|

Description

These pre-defined dose frequencies are sourced from **CDISC**. The number of rows to generate using `create_single_dose_dataset()` arguments `start_date` and `end_date` is derived from `DOSE_COUNT`, `DOSE_WINDOW`, and `CONVERSION_FACTOR` with appropriate functions from `lubridate`.

Usage

```
dose_freq_lookup
```

Format

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 86 rows and 5 columns.

Details

`NCI_CODE` and `CDISC_VALUE` are included from the **CDISC** source for traceability.

`DOSE_COUNT` represents the number of doses received in one single unit of `DOSE_WINDOW`. For example, for `CDISC_VALUE=="10 DAYS PER MONTH"`, `DOSE_WINDOW=="MONTH"` and `DOSE_COUNT==10`. Similarly, for `CDISC_VALUE=="EVERY 2 WEEKS"`, `DOSE_WINDOW=="WEEK"` and `DOSE_COUNT==0.5` (to yield one dose every two weeks).

`CONVERSION_FACTOR` is used to convert `DOSE_WINDOW` units "WEEK", "MONTH", and "YEAR" to the unit "DAY".

For example, for `CDISC_VALUE=="10 DAYS PER MONTH"`, `CONVERSION_FACTOR` is 0.0329. One day of a month is assumed to be 1 / 30.4375 of a month (one day is assumed to be 1/365.25 of a year). Given only `start_date` and `end_date` in the aggregate dataset, `CONVERSION_FACTOR` is used to calculate specific dates for `start_date` and `end_date` in the resulting single dose dataset for the doses that occur. In such cases, doses are assumed to occur at evenly spaced increments over the interval.

To see the entire table in the console, run `print(dose_freq_lookup)`.

dtm_level *Create a dtm_level object*

Description

Create a dtm_level object

Usage

```
dtm_level(level)
```

Arguments

level Datetime level
Permitted Values: "Y" (year, highest level), "M" (month), "D" (day), "h" (hour),
"m" (minute), "s" (second, lowest level), "n" (none)

Details

A dtm_level object is an ordered factor, i.e., two objects can be compared.

Value

A dtm_level object

Author(s)

Stefan Bundfuss

event_source *Create an event_source Object*

Description

event_source objects are used to define events as input for the `derive_param_tte()` function.

Usage

```
event_source(dataset_name, filter = NULL, date, set_values_to = NULL)
```

Arguments

| | |
|---------------|---|
| dataset_name | The name of the source dataset The name refers to the dataset provided by the <code>source_datasets</code> parameter of <code>derive_param_tte()</code> . |
| filter | An unquoted condition for selecting the observations from dataset which are events or possible censoring time points. |
| date | A variable providing the date of the event or censoring. A date, or a datetime can be specified. An unquoted symbol is expected. Refer to <code>derive_vars_dt()</code> to impute and derive a date from a date character vector to a date object. |
| set_values_to | A named list returned by <code>vars()</code> defining the variables to be set for the event or censoring, e.g. <code>vars(EVENTDESC = "DEATH", SRCDOM = "ADSL", SRCVAR = "DTHDT")</code> . The values must be a symbol, a character string, a numeric value, or NA. |

Value

An object of class `event_source`, inheriting from class `tte_source`

Author(s)

Stefan Bundfuss

Examples

```
# Death event
event_source(
  dataset_name = "adsl",
  filter = DTHFL == "Y",
  date = DTHDT,
  set_values_to = vars(
    EVNTDESC = "DEATH",
    SRCDOM = "ADSL",
    SRCVAR = "DTHDT"
  )
)
```

extend_source_datasets

Add By Groups to All Datasets if Necessary

Description

The function ensures that the by variables are contained in all source datasets.

Usage

```
extend_source_datasets(source_datasets, by_vars)
```

Arguments

`source_datasets`

Source datasets

A named list of datasets is expected. Each dataset must contain either all by variables or none of the by variables.

`by_vars`

By variables

Details

1. The by groups are determined as the union of the by groups occurring in the source datasets.
2. For all source datasets which do not contain the by variables the source dataset is replaced by the cartesian product of the source dataset and the by groups.

Value

The list of extended source datasets

Author(s)

Stefan Bundfuss

| | |
|-----------|-------------------------------------|
| ex_single | <i>Single Dose Exposure Dataset</i> |
|-----------|-------------------------------------|

Description

A derived dataset with single dose per date.

Usage

```
ex_single
```

Format

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 22439 rows and 17 columns.

Source

Derived from the `ex` dataset using `{admiral}` and `{dplyr}` (https://github.com/pharmaverse/admiral/blob/main/inst/example_scripts/derive_single_dose.R)

Other datasets: [admiral_adsl](#), [atoxgr_criteria_ctcv4](#), [queries_mh](#), [queries](#)

filter_confirmation *Filter Confirmed Observations*

Description

The function filters observation using a condition taking other observations into account. For example, it could select all observations with AVALC == "Y" and AVALC == "Y" for at least one subsequent observation. The input dataset is joined with itself to enable conditions taking variables from both the current observation and the other observations into account. The suffix ".join" is added to the variables from the subsequent observations.

An example usage might be checking if a patient received two required medications within a certain timeframe of each other.

In the oncology setting, for example, we use such processing to check if a response value can be confirmed by a subsequent assessment. This is commonly used in endpoints such as best overall response.

Usage

```
filter_confirmation(
  dataset,
  by_vars,
  join_vars,
  join_type,
  first_cond = NULL,
  order,
  filter,
  check_type = "warning"
)
```

Arguments

| | |
|-----------|---|
| dataset | Input dataset The variables specified for by_vars, join_vars, and order are expected. |
| by_vars | By variables The specified variables are used as by variables for joining the input dataset with itself. |
| join_vars | Variables to keep from joined dataset The variables needed from the other observations should be specified for this parameter. The specified variables are added to the joined dataset with suffix ".join". For example to select all observations with AVALC == "Y" and AVALC == "Y" for at least one subsequent visit join_vars = vars(AVALC, AVISITN) |

and `filter = AVALC == "Y" & AVALC.join == "Y" & AVISITN < AVISITN.join` could be specified.

The `*.join` variables are not included in the output dataset.

| | |
|-------------------------|--|
| <code>join_type</code> | <p>Observations to keep after joining</p> <p>The argument determines which of the joined observations are kept with respect to the original observation. For example, if <code>join_type = "after"</code> is specified all observations after the original observations are kept.</p> <p><i>Permitted Values:</i> "before", "after", "all"</p> |
| <code>first_cond</code> | <p>Condition for selecting range of data</p> <p>If this argument is specified, the other observations are restricted up to the first observation where the specified condition is fulfilled. If the condition is not fulfilled for any of the subsequent observations, all observations are removed.</p> |
| <code>order</code> | <p>Order</p> <p>The observations are ordered by the specified order.</p> |
| <code>filter</code> | <p>Condition for selecting observations</p> <p>The filter is applied to the joined dataset for selecting the confirmed observations. The condition can include summary functions. The joined dataset is grouped by the original observations. I.e., the summary function are applied to all observations up to the confirmation observation. For example in the oncology setting when using this function for confirmed best overall response, <code>filter = AVALC == "CR" & all(AVALC.join %in% c("CR", "NE")) & count_vals(var = AVALC.join, val = "NE") <= 1</code> selects observations with response "CR" and for all observations up to the confirmation observation the response is "CR" or "NE" and there is at most one "NE".</p> |
| <code>check_type</code> | <p>Check uniqueness?</p> <p>If "warning" or "error" is specified, the specified message is issued if the observations of the input dataset are not unique with respect to the by variables and the order.</p> <p><i>Default:</i> "none"</p> <p><i>Permitted Values:</i> "none", "warning", "error"</p> |

Details

The following steps are performed to produce the output dataset.

Step 1:

The input dataset is joined with itself by the variables specified for `by_vars`. From the right hand side of the join only the variables specified for `join_vars` are kept. The suffix ".join" is added to these variables.

For example, for `by_vars = USUBJID`, `join_vars = vars(AVISITN, AVALC)` and input dataset

```
# A tibble: 2 x 4
  USUBJID AVISITN AVALC  AVAL
<chr>    <dbl> <chr> <dbl>
1       1      1 Y      1
1       1      2 N      0
```

the joined dataset is

```
A tibble: 4 x 6
  USUBJID AVISITN AVALC  AVAL AVISITN.join AVALC.join
<chr>    <dbl> <chr> <dbl>         <dbl> <chr>
1         1 Y      1         1 Y
1         1 Y      1         2 N
1         2 N      0         1 Y
1         2 N      0         2 N
```

Step 2:

The joined dataset is restricted to observations with respect to `join_type` and `order`.

The dataset from the example in the previous step with `join_type = "after"` and `order = vars(AVISITN)` is restricted to

```
A tibble: 4 x 6
  USUBJID AVISITN AVALC  AVAL AVISITN.join AVALC.join
<chr>    <dbl> <chr> <dbl>         <dbl> <chr>
1         1 Y      1         1 Y
1         1 Y      1         2 N
```

Step 3:

If `first_cond` is specified, for each observation of the input dataset the joined dataset is restricted to observations up to the first observation where `first_cond` is fulfilled (the observation fulfilling the condition is included). If for an observation of the input dataset the condition is not fulfilled, the observation is removed.

Step 4:

The joined dataset is grouped by the observations from the input dataset and restricted to the observations fulfilling the condition specified by `filter`.

Step 5:

The first observation of each group is selected and the `*.join` variables are dropped.

Value

A subset of the observations of the input dataset. All variables of the input dataset are included in the output dataset.

    )
)

```

filter_date_sources *Select the First or Last Date from Several Sources*

Description

Select for each subject the first or last observation with respect to a date from a list of sources.

Usage

```

filter_date_sources(
  sources,
  source_datasets,
  by_vars,
  create_datetime = FALSE,
  subject_keys,
  mode
)

```

Arguments

| | |
|-----------------|---|
| sources | Sources A list of tte_source() objects is expected. |
| source_datasets | Source datasets A named list of datasets is expected. The dataset_name field of tte_source() refers to the dataset provided in the list. |
| by_vars | By variables If the parameter is specified, for each by group the observations are selected separately. |

| | |
|-----------------|--|
| create_datetime | Create datetime variable? If set to TRUE, variables ADTM is created. Otherwise, variables ADT is created. |
| subject_keys | Variables to uniquely identify a subject A list of symbols created using vars() is expected. |
| mode | Selection mode (first or last) If "first" is specified, for each subject the first observation with respect to the date is included in the output dataset. If "last" is specified, the last observation is included in the output dataset. Permitted Values: "first", "last" |

Details

The following steps are performed to create the output dataset:

1. For each source dataset the observations as specified by the filter element are selected. Then for each patient the first or last observation (with respect to date) is selected.
2. The ADT variable is set to the variable specified by the date element. If the date variable is a datetime variable, only the datepart is copied. If the source variable is a character variable, it is converted to a date. If the date is incomplete, it is imputed as the first possible date.
3. The CNSR is added and set to the value of the censor element.
4. The selected observations of all source datasets are combined into a single dataset.
5. For each patient the first or last observation (with respect to the ADT variable) from the single dataset is selected.

Value

A dataset with one observation per subject as described in the "Details" section.

```

 filter_extreme

Filter the First or Last Observation for Each By Group

Description

Filters the first or last observation for each by group.

Usage

```
filter_extreme(dataset, by_vars = NULL, order, mode, check_type = "warning")
```

Arguments

| | |
|------------|--|
| dataset | Input dataset The variables specified by the order and the by_vars parameter are expected. |
| by_vars | Grouping variables <i>Default:</i> NULL <i>Permitted Values:</i> list of variables created by vars() |
| order | Sort order Within each by group the observations are ordered by the specified order. <i>Permitted Values:</i> list of variables or desc(<variable>) function calls created by vars(), e.g., vars(ADT, desc(AVAL)) |
| mode | Selection mode (first or last) If "first" is specified, the first observation of each by group is included in the output dataset. If "last" is specified, the last observation of each by group is included in the output dataset. <i>Permitted Values:</i> "first", "last" |
| check_type | Check uniqueness? If "warning" or "error" is specified, the specified message is issued if the observations of the input dataset are not unique with respect to the by variables and the order. <i>Default:</i> "warning" <i>Permitted Values:</i> "none", "warning", "error" |

Details

For each group (with respect to the variables specified for the by_vars parameter) the first or last observation (with respect to the order specified for the order parameter and the mode specified for the mode parameter) is included in the output dataset.

Value

A dataset containing the first or last observation of each by group

library(admiral.test)
data("admiral_ex")
```

```

# Select first dose for each patient
admiral_ex %>%
  filter_extreme(
    by_vars = vars(USUBJID),
    order = vars(EXSEQ),
    mode = "first"
  ) %>%
  select(USUBJID, EXSEQ)

# Select highest dose for each patient on the active drug
admiral_ex %>%
  filter(EXTRT != "PLACEBO") %>%
  filter_extreme(
    by_vars = vars(USUBJID),
    order = vars(EXDOSE),
    mode = "last",
    check_type = "none"
  ) %>%
  select(USUBJID, EXTRT, EXDOSE)

```

filter_relative

Filter the Observations Before or After a Condition is Fulfilled

Description

Filters the observations before or after the observation where a specified condition is fulfilled for each by group. For example, the function could be called to select for each subject all observations before the first disease progression.

Usage

```

filter_relative(
  dataset,
  by_vars,
  order,
  condition,
  mode,
  selection,
  inclusive,
  keep_no_ref_groups = TRUE,
  check_type = "warning"
)

```

Arguments

| | |
|---------|--|
| dataset | Input dataset |
| by_vars | Grouping variables <i>Permitted Values:</i> list of variables created by vars() |

| | |
|--------------------|---|
| order | Sort order Within each by group the observations are ordered by the specified order. <i>Permitted Values:</i> list of variables or desc(<variable>) function calls created by vars(), e.g., vars(ADT, desc(AVAL)) |
| condition | Condition for Reference Observation The specified condition determines the reference observation. The output dataset contains all observations before or after (selection parameter) the reference observation. |
| mode | Selection mode (first or last) If "first" is specified, for each by group the observations before or after (selection parameter) the observation where the condition (condition parameter) is fulfilled the <i>first</i> time is included in the output dataset. If "last" is specified, for each by group the observations before or after (selection parameter) the observation where the condition (condition parameter) is fulfilled the <i>last</i> time is included in the output dataset. <i>Permitted Values:</i> "first", "last" |
| selection | Select observations before or after the reference observation? <i>Permitted Values:</i> "before", "after" |
| inclusive | Include the reference observation? <i>Permitted Values:</i> TRUE, FALSE |
| keep_no_ref_groups | Should by groups without reference observation be kept? <i>Default:</i> TRUE <i>Permitted Values:</i> TRUE, FALSE |
| check_type | Check uniqueness? If "warning" or "error" is specified, the specified message is issued if the observations of the input dataset are not unique with respect to the by variables and the order. <i>Default:</i> "none" <i>Permitted Values:</i> "none", "warning", "error" |

Details

For each by group (by_vars parameter) the observations before or after (selection parameter) the observations where the condition (condition parameter) if fulfilled the first or last time (order parameter and mode parameter) is included in the output dataset.

Value

A dataset containing for each by group the observations before or after the observation where the condition was fulfilled the first or last time

format.sdg_select *Returns a Character Representation of a sdg_select() Object*

Description

The function returns a character representation of a `sdg_select()` object. It can be used for error messages for example.

Usage

```

## S3 method for class 'sdg_select'
format(x, ...)

```

Arguments

| | |
|-----|------------------------------------|
| x | A <code>sdg_select()</code> object |
| ... | Not used |

Value

A character representation of the `sdg_select()` object

Author(s)

Stefan Bundfuss

```

`format_eoxxstt_default`*Default Format for Disposition Status*

Description

Define a function to map the disposition status. To be used as an input for `derive_var_disposition_status()`.

Usage

```
format_eoxxstt_default(status)
```

Arguments

`status` the disposition variable used for the mapping (e.g. DSDECOD).

Details

Usually this function can not be used with `%>%`.

Value

A character vector derived based on the values given in `status`: "NOT STARTED" if `status` is "SCREEN FAILURE" or "SCREENING NOT COMPLETED", "COMPLETED" if `status` is "COMPLETED", "DISCONTINUED" if `status` is not in ("COMPLETED", "SCREEN FAILURE", "SCREENING NOT COMPLETED") nor NA, "ONGOING" otherwise.

library(dplyr, warn.conflicts = FALSE)
library(admiral.test)
data("admiral_dm")
data("admiral_ds")

admiral_dm %>%
  derive_var_disposition_status(
    dataset_ds = admiral_ds,
    new_var = EOSSTT,
```

```
status_var = DSDECOD,  
format_new_var = format_eoxxstt_default,  
filter_ds = DSCAT == "DISPOSITION EVENT"  
) %>%  
select(STUDYID, USUBJID, EOSSTT)
```

format_reason_default *Default Format for the Disposition Reason*

Description

Define a function to map the disposition reason, to be used as a parameter in `derive_vars_disposition_reason()`.

Usage

```
format_reason_default(reason, reason_spe = NULL)
```

Arguments

| | |
|------------|---|
| reason | the disposition variable used for the mapping (e.g. DSDECOD). |
| reason_spe | the disposition variable used for the mapping of the details if required (e.g. DSTERM). |

Details

`format_reason_default(DSDECOD)` returns DSDECOD when DSDECOD is not 'COMPLETED' nor NA. `format_reason_default(DSDECOD, DSTERM)` returns DSTERM when DSDECOD is equal to 'OTHER'. Usually this function can not be used with `%>%`.

Value

A character vector

    dataset_ds = admiral_ds,
    new_var = DCSREAS,
    reason_var = DSDECOD,
    format_new_vars = format_reason_default,
    filter_ds = DSCAT == "DISPOSITION EVENT"
  ) %>%
  select(STUDYID, USUBJID, DCSREAS)
```

get_duplicates_dataset

Get Duplicate Records that Lead to a Prior Error

Description

Get Duplicate Records that Lead to a Prior Error

Usage

```
get_duplicates_dataset()
```

Details

Many admiral function check that the input dataset contains only one record per `by_vars` group and throw an error otherwise. The `get_duplicates_dataset()` function allows one to retrieve the duplicate records that lead to an error.

Note that the function always returns the dataset of duplicates from the last error that has been thrown in the current R session. Thus, after restarting the R sessions `get_duplicates_dataset()` will return NULL and after a second error has been thrown, the dataset of the first error can no longer be accessed (unless it has been saved in a variable).

Value

A data.frame or NULL

Author(s)

Thomas Neitmann

See Also

Utilities for Dataset Checking: [extract_duplicate_records\(\)](#), [get_many_to_one_dataset\(\)](#), [get_one_to_many_dataset\(\)](#)

Examples

```
data(admiral_adsl)

# Duplicate the first record
adsl <- rbind(admiral_adsl[1L, ], admiral_adsl)

signal_duplicate_records(adsl, vars(USUBJID), cnd_type = "warning")

get_duplicates_dataset()
```

get_imputation_target_date

Get Date Imputation Targets

Description

Get Date Imputation Targets

Usage

```
get_imputation_target_date(date_imputation, month)
```

Arguments

date_imputation

The value to impute the day/month when a datepart is missing.

A character value is expected, either as a

- format with month and day specified as "mm-dd": e.g. "06-15" for the 15th of June,
- or as a keyword: "first", "mid", "last" to impute to the first/mid/last day/month.

month

Month component of the partial date

Details

- For date_imputation = "first" "0000", "01", "01" are returned.
- For date_imputation = "mid" "xxxx", "06", "30" if month is NA and "15" otherwise are returned.
- For date_imputation = "last" "9999", "12", "31" are returned.
- For date_imputation = "<mm>-<dd>" "xxxx", "<mm>", "<dd>" are returned.

"xxxx" indicates that the component is undefined. If an undefined component occurs in the imputed DTC value, the imputed DTC value is set to NA_character_ in the imputation functions.

Value

A list of character vectors. The elements of the list are named "year", "month", "day".

get_imputation_target_time

Get Time Imputation Targets

Description

Get Time Imputation Targets

Usage

```
get_imputation_target_time(time_imputation)
```

Arguments

time_imputation

The value to impute the time when a timepart is missing.

A character value is expected, either as a

- format with hour, min and sec specified as "hh:mm:ss": e.g. "00:00:00" for the start of the day,
- or as a keyword: "first", "last" to impute to the start/end of a day.

Details

- For time_imputation = "first" "00", "00", "00" are returned.
- For time_imputation = "last" "23", "59", "59" are returned.
- For time_imputation = "<hh>:<mm>:<ss>" "<hh>", "<mm>", "<ss>" are returned.

Value

A list of character vectors. The elements of the list are named "hour", "minute", "second".

get_many_to_one_dataset

Get Many to One Values that Led to a Prior Error

Description

Get Many to One Values that Led to a Prior Error

Usage

```
get_many_to_one_dataset()
```

Details

If `assert_one_to_one()` detects an issue, the many to one values are stored in a dataset. This dataset can be retrieved by `get_many_to_one_dataset()`.

Note that the function always returns the many to one values from the last error that has been thrown in the current R session. Thus, after restarting the R sessions `get_many_to_one_dataset()` will return NULL and after a second error has been thrown, the dataset of the first error can no longer be accessed (unless it has been saved in a variable).

Value

A data.frame or NULL

get_partialdatetime *Parse DTC variable and Determine Components*

Description

Parse DTC variable and Determine Components

Usage

```
get_partialdatetime(dtc)
```

Arguments

| | |
|-----|---|
| dtc | The '--DTC' date to parse A character date is expected in a format like yyyy-mm-dd or yyyy-mm-ddThh:mm:ss. Trailing components can be omitted and - is a valid value for any component. |
|-----|---|

Details

The function can be replaced by the parttime parser once it is available.

Value

A list of character vectors. The elements of the list are named "year", "month", "day", "hour", "minute", and "second". Missing components are set to NA_character_.

get_summary_records *Create Summary Records*

Description

It is not uncommon to have an analysis need whereby one needs to derive an analysis value (AVAL) from multiple records. The ADaM basic dataset structure variable DTYPE is available to indicate when a new derived records has been added to a dataset.

Usage

```
get_summary_records(
  dataset,
  by_vars,
  filter = NULL,
  analysis_var,
  summary_fun,
  set_values_to
)
```

Arguments

| | |
|--------------|---|
| dataset | A data frame. |
| by_vars | Variables to consider for generation of groupwise summary records. Providing the names of variables in vars() will create a groupwise summary and generate summary records for the specified groups. |
| filter | Filter condition as logical expression to apply during summary calculation. By default, filtering expressions are computed within <code>by_vars</code> as this will help when an aggregating, lagging, or ranking function is involved. For example, <ul style="list-style-type: none"> • <code>filter_rows = (AVAL > mean(AVAL, na.rm = TRUE))</code> will filter all AVAL values greater than mean of AVAL with in <code>by_vars</code>. • <code>filter_rows = (dplyr::n() > 2)</code> will filter n count of <code>by_vars</code> greater than 2. |
| analysis_var | Analysis variable. |
| summary_fun | Function that takes as an input the <code>analysis_var</code> and performs the calculation. This can include built-in functions as well as user defined functions, for example <code>mean</code> or <code>function(x) mean(x, na.rm = TRUE)</code> . |

`set_values_to` A list of variable name-value pairs. Use this argument if you need to change the values of any newly derived records.

Set a list of variables to some specified value for the new observation(s)

- LHS refer to a variable.
- RHS refers to the values to set to the variable. This can be a string, a symbol, a numeric value or NA. (e.g. `vars(PARAMCD = "TDOSE", PARCAT1 = "OVERALL")`). More general expression are not allowed.

Details

This function only creates derived observations and does not append them to the original dataset observations. If you would like to this instead, see the `derive_summary_records()` function.

Value

A data frame of derived records.

Author(s)

Pavan Kumar, updated by Alana Harris

get_terms_from_db

Get Terms from the Queries Database

Description

The function checks if all requirements to access the database are fulfilled (version and access function are available, see `assert_db_requirements()`), reads the terms from the database, and checks if the dataset with the terms is in the expected format (see `assert_terms()`).

Usage

```

get_terms_from_db(
  version,
  fun,
  queries,
  definition,
  expect_query_name = FALSE,
  expect_query_id = FALSE,
  i,
  temp_env,
  type
)

```

Arguments

| | |
|---------|---|
| version | Version The version must be non null. Otherwise, an error is issued. The value is passed to the access function (fun). |
| fun | Access function The access function must be non null. Otherwise, an error is issued. The function is called to retrieve the terms. |

| | |
|-------------------|--|
| queries | Queries List of all queries passed to create_query_data(). It is used for error messages. |
| definition | Definition of the query The definition is passed to the access function. It defines which terms are returned. |
| expect_query_name | Is QUERY_NAME expected in the output dataset? |
| expect_query_id | Is QUERY_ID expected in the output dataset? |
| i | Index of definition in queries The value is used for error messages. |
| temp_env | Temporary environment The value is passed to the access function. |
| type | Type of query <i>Permitted Values:</i> "smq", "sdg" |

Value

Output dataset of the access function

Author(s)

Stefan Bundfuss

impute_dtc_dt

Impute Partial Date Portion of a '--DTC' Variable

Description

Imputation partial date portion of a '--DTC' variable based on user input.

Usage

```
impute_dtc_dt(
  dtc,
  highest_imputation = "n",
  date_imputation = "first",
  min_dates = NULL,
  max_dates = NULL,
  preserve = FALSE
)
```

Arguments

- dtc** The '--DTC' date to impute
A character date is expected in a format like yyyy-mm-dd or yyyy-mm-ddThh:mm:ss. Trailing components can be omitted and - is a valid "missing" value for any component.
- highest_imputation** Highest imputation level
The highest_imputation argument controls which components of the DTC value are imputed if they are missing. All components up to the specified level are imputed.
If a component at a higher level than the highest imputation level is missing, NA_character_ is returned. For example, for highest_imputation = "D" "2020" results in NA_character_ because the month is missing.
If "n" is specified no imputation is performed, i.e., if any component is missing, NA_character_ is returned.
If "Y" is specified, date_imputation should be "first" or "last" and min_dates or max_dates should be specified respectively. Otherwise, NA_character_ is returned if the year component is missing.
Default: "n"
Permitted Values: "Y" (year, highest level), "M" (month), "D" (day), "n" (none, lowest level)
- date_imputation** The value to impute the day/month when a datepart is missing.
A character value is expected, either as a
- format with month and day specified as "mm-dd": e.g. "06-15" for the 15th of June (The year can not be specified; for imputing the year "first" or "last" together with min_dates or max_dates argument can be used (see examples).),
 - or as a keyword: "first", "mid", "last" to impute to the first/mid/last day/month.
- The argument is ignored if highest_imputation is less than "D".
Default: "first"
- min_dates** Minimum dates
A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example
- ```
impute_dtc_dtm(
 "2020-11",
 min_dates = list(
 ymd_hms("2020-12-06T12:12:12"),
 ymd_hms("2020-11-11T11:11:11")
)
)
```

```

),
 highest_imputation = "M"
)

```

returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12" is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).

|           |                                                                                                                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| max_dates | <p>Maximum dates</p> <p>A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.</p> |
| preserve  | <p>Preserve day if month is missing and day is present</p> <p>For example "2019--07" would return "2019-06-07" if preserve = TRUE (and date_imputation = "MID").</p> <p>Permitted Values: TRUE, FALSE</p> <p>Default: FALSE</p>                                                                                   |

### Details

Usually this computation function can not be used with %>%.

### Value

A character vector

### Author(s)

Samia Kabi, Stefan Bundfuss

### Examples

```

library(lubridate)

dates <- c(
 "2019-07-18T15:25:40",
 "2019-07-18T15:25",
 "2019-07-18T15",
 "2019-07-18",
 "2019-02",
 "2019",
 "2019",
 "2019---07",
 ""
)

```

```
)

No date imputation (highest_imputation defaulted to "n")
impute_dtc_dt(dtc = dates)

Impute to first day/month if date is partial
impute_dtc_dt(
 dtc = dates,
 highest_imputation = "M"
)
Same as above
impute_dtc_dtm(
 dtc = dates,
 highest_imputation = "M",
 date_imputation = "01-01"
)

Impute to last day/month if date is partial
impute_dtc_dt(
 dtc = dates,
 highest_imputation = "M",
 date_imputation = "last",
)

Impute to mid day/month if date is partial
impute_dtc_dt(
 dtc = dates,
 highest_imputation = "M",
 date_imputation = "mid"
)

Impute a date and ensure that the imputed date is not before a list of
minimum dates
impute_dtc_dt(
 "2020-12",
 min_dates = list(
 ymd("2020-12-06"),
 ymd("2020-11-11")
),
 highest_imputation = "M"
)

Impute completely missing dates (only possible if min_dates or max_dates is specified)
impute_dtc_dt(
 c("2020-12", NA_character_),
 min_dates = list(
 ymd("2020-12-06"),
 ymd("2020-11-11")
),
 highest_imputation = "Y"
)
```

|----------------|-----------------------------------------------------------------|
| impute_dtc_dtm | <i>Impute Partial Date(-time) Portion of a '--DTC' Variable</i> |
|----------------|-----------------------------------------------------------------|

---

### Description

Imputation partial date/time portion of a '--DTC' variable. based on user input.

### Usage

```
impute_dtc_dtm(
 dtc,
 highest_imputation = "h",
 date_imputation = "first",
 time_imputation = "first",
 min_dates = NULL,
 max_dates = NULL,
 preserve = FALSE
)
```

### Arguments

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

- format with month and day specified as "mm-dd": e.g. "06-15" for the 15th of June (The year can not be specified; for imputing the year "first" or "last" together with min\_dates or max\_dates argument can be used (see examples).),
- or as a keyword: "first", "mid", "last" to impute to the first/mid/last day/month.

The argument is ignored if highest\_imputation is less than "D".

*Default:* "first".

time\_imputation

The value to impute the time when a timepart is missing.

A character value is expected, either as a

- format with hour, min and sec specified as "hh:mm:ss": e.g. "00:00:00" for the start of the day,
- or as a keyword: "first", "last" to impute to the start/end of a day.

The argument is ignored if highest\_imputation = "n".

*Default:* "first".

min\_dates

Minimum dates

A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example

```
impute_dtc_dtm(
 "2020-11",
 min_dates = list(
 ymd_hms("2020-12-06T12:12:12"),
 ymd_hms("2020-11-11T11:11:11")
),
 highest_imputation = "M"
)
```

returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12" is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).

For date variables (not datetime) in the list the time is imputed to "00:00:00". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.

max\_dates

Maximum dates

A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.

For date variables (not datetime) in the list the time is imputed to "23:59:59". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.

preserve      Preserve day if month is missing and day is present  
 For example "2019---07" would return "2019-06-07" if preserve = TRUE (and date\_imputation = "mid").  
 Permitted Values: TRUE, FALSE  
*Default:* FALSE

### Details

Usually this computation function can not be used with %>%.

### Value

A character vector

### Author(s)

Samia Kabi, Stefan Bundfuss

### Examples

```
library(lubridate)

dates <- c(
 "2019-07-18T15:25:40",
 "2019-07-18T15:25",
 "2019-07-18T15",
 "2019-07-18",
 "2019-02",
 "2019",
 "2019",
 "2019---07",
 ""
)

No date imputation (highest_imputation defaulted to "h")
Missing time part imputed with 00:00:00 portion by default
impute_dtc_dtm(dtc = dates)

No date imputation (highest_imputation defaulted to "h")
Missing time part imputed with 23:59:59 portion
impute_dtc_dtm(
 dtc = dates,
 time_imputation = "23:59:59"
)

Same as above
```

```

impute_dtc_dtm(
 dtc = dates,
 time_imputation = "last"
)

Impute to first day/month if date is partial
Missing time part imputed with 00:00:00 portion by default
impute_dtc_dtm(
 dtc = dates,
 highest_imputation = "M"
)
same as above
impute_dtc_dtm(
 dtc = dates,
 highest_imputation = "M",
 date_imputation = "01-01"
)

Impute to last day/month if date is partial
Missing time part imputed with 23:59:59 portion
impute_dtc_dtm(
 dtc = dates,
 date_imputation = "last",
 time_imputation = "last"
)

Impute to mid day/month if date is partial
Missing time part imputed with 00:00:00 portion by default
impute_dtc_dtm(
 dtc = dates,
 highest_imputation = "M",
 date_imputation = "mid"
)

Impute a date and ensure that the imputed date is not before a list of
minimum dates
impute_dtc_dtm(
 "2020-12",
 min_dates = list(
 ymd_hms("2020-12-06T12:12:12"),
 ymd_hms("2020-11-11T11:11:11")
),
 highest_imputation = "M"
)

Impute completely missing dates (only possible if min_dates or max_dates is specified)
impute_dtc_dtm(
 c("2020-12", NA_character_),
 min_dates = list(
 ymd_hms("2020-12-06T12:12:12"),
 ymd_hms("2020-11-11T11:11:11")
),
 highest_imputation = "Y"
)

```

)

---

list\_all\_templates      *List All Available ADaM Templates*

---

**Description**

List All Available ADaM Templates

**Usage**

```
list_all_templates(package = "admiral")
```

**Arguments**

package            The R package in which to look for templates. By default "admiral".

**Value**

A character vector of all available templates

**Author(s)**

Shimeng Huang, Thomas Neitmann

**See Also**

Utilities used for examples and template scripts: [use\\_ad\\_template\(\)](#)

**Examples**

```
list_all_templates()
```

---

list\_tte\_source\_objects  
*List all tte\_source Objects Available in a Package*

---

**Description**

List all tte\_source Objects Available in a Package

**Usage**

```
list_tte_source_objects(package = "admiral")
```

**Arguments**

package            The name of the package in which to search for tte\_source objects

**Value**

A data.frame where each row corresponds to one tte\_source object or NULL if package does not contain any tte\_source objects

**Author(s)**

Thomas Neitmann

**See Also**

```

---

max\_cond

*Maximum Value on a Subset*

---

**Description**

The function derives the maximum value of a vector/column on a subset of entries/observations.

**Usage**

```
max_cond(var, cond)
```

**Arguments**

var                A vector  
cond               A condition

**Author(s)**

Stefan Bundfuss

**See Also**

 params

*Create a Set of Parameters*

---

**Description**

Create a set of variable parameters/function arguments to be used in [call\\_derivation\(\)](#).

**Usage**

```
params(...)
```

**Arguments**

... One or more named arguments

**Value**

An object of class `params`

**Author(s)**

Thomas Neitmann, Tracey Wang

**See Also**

[call\\_derivation\(\)](#)

Source Specifications: [assert\\_db\\_requirements\(\)](#), [assert\\_terms\(\)](#), [assert\\_valid\\_queries\(\)](#), [censor\\_source\(\)](#), [date\\_source\(\)](#), [death\\_event](#), [derive\\_var\\_dthcaus\(\)](#), [event\\_source\(\)](#), [extend\\_source\\_datasets\(\)](#), [filter\\_date\\_sources\(\)](#), [format.sdg\\_select\(\)](#), [format.smq\\_select\(\)](#), [list\\_tte\\_source\\_objects\(\)](#), [query\(\)](#), [sdg\\_select\(\)](#), [smq\\_select\(\)](#), [tte\\_source\(\)](#), [validate\\_query\(\)](#), [validate\\_sdg\\_select\(\)](#), [validate\\_smq\\_select\(\)](#)

**Examples**

```
library(dplyr, warn.conflicts = FALSE)
library(admiral.test)
data(admiral_ae)
data(admiral_adsl)

adae <- admiral_ae[sample(1:nrow(admiral_ae), 1000),] %>%
 select(USUBJID, AESTDTC, AEENDTC) %>%
 derive_vars_merged(
 dataset_add = admiral_adsl,
 new_vars = vars(TRTSDT, TRTEDT),
 by_vars = vars(USUBJID)
)

In order to derive both `ASTDT` and `AENDT` in `ADAE`, one can use `derive_vars_dt()`
adae %>%
 derive_vars_dt(
 new_vars_prefix = "AST",
 dtc = AESTDTC,
 date_imputation = "first",
 min_dates = vars(TRTSDT),
 max_dates = vars(TRTEDT)
) %>%
 derive_vars_dt(
 new_vars_prefix = "AEN",
 dtc = AEENDTC,
 date_imputation = "last",
 min_dates = vars(TRTSDT),
 max_dates = vars(TRTEDT)
)

While `derive_vars_dt()` can only add one variable at a time, using `call_derivation()`
one can add multiple variables in one go.
The function arguments which are different from a variable to another (e.g. `new_vars_prefix`,
`dtc`, and `date_imputation`) are specified as a list of `params()` in the `variable_params`
argument of `call_derivation()`. All other arguments which are common to all variables
(e.g. `min_dates` and `max_dates`) are specified outside of `variable_params` (i.e. in `...`).
call_derivation(
 dataset = adae,
 derivation = derive_vars_dt,
 variable_params = list(
 params(dtc = AESTDTC, date_imputation = "first", new_vars_prefix = "AST"),
```

```
 params(dtc = AEENDTC, date_imputation = "last", new_vars_prefix = "AEN")
),
 min_dates = vars(TRTSDT),
 max_dates = vars(TRTEDT)
)

The above call using `call_derivation()` is equivalent to the call using `derive_vars_dt()`
to derive variables `ASTDT` and `AENDT` separately at the beginning.
```

---

print.derivation\_slice

*Print derivation\_slice Objects*

---

## Description

Print derivation\_slice Objects

## Usage

```
S3 method for class 'derivation_slice'
print(x, ...)
```

## Arguments

|     |                           |
|-----|---------------------------|
| x   | A derivation_slice object |
| ... | Not used                  |

## Value

No return value, called for side effects

|       |                               |
|-------|-------------------------------|
| query | <i>Create an query object</i> |
|-------|-------------------------------|

---

### Description

A query object defines a query, e.g., a Standard MedDRA Query (SMQ), a Standardized Drug Grouping (SDG), or a customized query (CQ). It is used as input to `create_query_data()`.

### Usage

```
query(prefix, name = auto, id = NULL, add_scope_num = FALSE, definition = NULL)
```

### Arguments

- |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| name          | The value is used to populate QUERY_NAME in the output dataset of <code>create_query_data()</code> . If the auto keyword is specified, the variable is set to the name of the query in the SMQ/SDG database.<br><i>Permitted Values:</i> A character scalar or the auto keyword. The auto keyword is permitted only for queries which are defined by an <code>smq_select()</code> or <code>sdg_select()</code> object.                                                                                                                                                                                                                                                                                                                   |
| id            | The value is used to populate QUERY_ID in the output dataset of <code>create_query_data()</code> . If the auto keyword is specified, the variable is set to the id of the query in the SMQ/SDG database.<br><i>Permitted Values:</i> A integer scalar or the auto keyword. The auto keyword is permitted only for queries which are defined by an <code>smq_select()</code> or <code>sdg_select()</code> object.                                                                                                                                                                                                                                                                                                                         |
| add_scope_num | Determines if QUERY_SCOPE_NUM in the output dataset of <code>create_query_data()</code> is populated<br>If the parameter is set to TRUE, the definition must be an <code>smq_select()</code> object.<br><i>Default:</i> FALSE<br><i>Permitted Values:</i> TRUE, FALSE                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| definition    | Definition of terms belonging to the query<br>There are four different ways to define the terms: <ul style="list-style-type: none"> <li>• An <code>smq_select()</code> object is specified to select a query from the SMQ database.</li> <li>• An <code>sdg_select()</code> object is specified to select a query from the SDG database.</li> <li>• A data frame with columns TERM_LEVEL and TERM_NAME or TERM_ID can be specified to define the terms of a customized query. The TERM_LEVEL should be set to the name of the variable which should be used to select the terms, e.g., "AEDECOD" or "AELLTCD". TERM_LEVEL does not need to be constant within a query. For example a query can be based on AEDECOD and AELLT.</li> </ul> |

If `TERM_LEVEL` refers to a character variable, `TERM_NAME` should be set to the value the variable. If it refers to a numeric variable, `TERM_ID` should be set to the value of the variable. If only character variables or only numeric variables are used, `TERM_ID` or `TERM_NAME` respectively can be omitted.

- A list of data frames and `smq_select()` objects can be specified to define a customized query based on custom terms and SMQs. The data frames must have the same structure as described for the previous item.

*Permitted Values:* an `smq_select()` object, an `sdg_select()` object, a data frame, or a list of data frames and `smq_select()` objects.

## Value

An object of class `query`.

## Examples

```
create a query for an SMQ
library(tibble)
library(magrittr, warn.conflicts = FALSE)
library(dplyr, warn.conflicts = FALSE)

query(
 prefix = "SMQ02",
 id = auto,
 definition = smq_select(
 name = "Pregnancy and neonatal topics (SMQ)",
 scope = "NARROW"
)
)

create a query for an SDG
query(
 prefix = "SDG01",
 id = auto,
 definition = sdg_select(
 name = "5-aminosalicylates for ulcerative colitis"
)
)
```

```
)
)

creating a query for a customized query
cqterms <- tribble(
 ~TERM_NAME, ~TERM_ID,
 "APPLICATION SITE ERYTHEMA", 10003041L,
 "APPLICATION SITE PRURITUS", 10003053L
) %>%
 mutate(TERM_LEVEL = "AEDECOD")

query(
 prefix = "CQ01",
 name = "Application Site Issues",
 definition = cqterms
)

creating a customized query based on SMQs and additional terms
query(
 prefix = "CQ03",
 name = "Special issues of interest",
 definition = list(
 cqterms,
 smq_select(
 name = "Pregnancy and neonatal topics (SMQ)",
 scope = "NARROW"
),
 smq_select(
 id = 8050L,
 scope = "BROAD"
)
)
)
)
```

---

restrict\_derivation     *Execute a Derivation on a Subset of the Input Dataset*

---

### Description

Execute a derivation on a subset of the input dataset.

### Usage

```
restrict_derivation(dataset, derivation, args = NULL, filter)
```

### Arguments

|            |               |
|------------|---------------|
| dataset    | Input dataset |
| derivation | Derivation    |

|        |                                                               |
|--------|---------------------------------------------------------------|
| args   | Arguments of the derivation<br>A params() object is expected. |
| filter | Filter condition                                              |

**Author(s)**

Stefan Bundfuss

```
library(magrittr)
adlb <- tibble::tribble(
 ~USUBJID, ~AVISITN, ~AVAL, ~ABLFL,
 "1", -1, 113, NA_character_,
 "1", 0, 113, "Y",
 "1", 3, 117, NA_character_,
 "2", 0, 95, "Y",
 "3", 0, 111, "Y",
 "3", 1, 101, NA_character_,
 "3", 2, 123, NA_character_
)

Derive BASE for post-baseline records only (derive_var_base() can not be used in this case
as it requires the baseline observation to be in the input dataset)
restrict_derivation(
 adlb,
 derivation = derive_vars_merged,
 args = params(
 by_vars = vars(USUBJID),
 dataset_add = adlb,
 filter_add = ABLFL == "Y",
 new_vars = vars(BASE = AVAL)
),
 filter = AVISITN > 0
)

Derive BASE for baseline and post-baseline records only
restrict_derivation(
 adlb,
 derivation = derive_var_base,
 args = params(
 by_vars = vars(USUBJID)
),
 filter = AVISITN >= 0
)
```

```

) %>%
 # Derive CHG for post-baseline records only
 restrict_derivation(
 derivation = derive_var_chg,
 filter = AVISITN > 0
)

```

---

restrict\_imputed\_dtc\_dt

*Restrict Imputed DTC date to Minimum/Maximum Dates*

---

## Description

Restrict Imputed DTC date to Minimum/Maximum Dates

## Usage

```
restrict_imputed_dtc_dt(dtc, imputed_dtc, min_dates, max_dates)
```

## Arguments

**dtc** The '--DTC' date to impute  
A character date is expected in a format like yyyy-mm-dd or yyyy-mm-ddThh:mm:ss. Trailing components can be omitted and - is a valid "missing" value for any component.

**imputed\_dtc** The imputed DTC date

**min\_dates** Minimum dates

A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example

```

impute_dtc_dtm(
 "2020-11",
 min_dates = list(
 ymd_hms("2020-12-06T12:12:12"),
 ymd_hms("2020-11-11T11:11:11")
),
 highest_imputation = "M"
)

```

returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12" is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).

`max_dates`      Maximum dates  
 A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.

### Value

- The last of the minimum dates (`min_dates`) which are in the range of the partial DTC date (`dtc`)
- The first of the maximum dates (`max_dates`) which are in the range of the partial DTC date (`dtc`)
- `imputed_dtc` if the partial DTC date (`dtc`) is not in range of any of the minimum or maximum dates.

### Author(s)

Stefan Bundfuss

---

`restrict_imputed_dtc_dtm`

*Restrict Imputed DTC date to Minimum/Maximum Dates*

---

### Description

Restrict Imputed DTC date to Minimum/Maximum Dates

### Usage

```
restrict_imputed_dtc_dtm(dtc, imputed_dtc, min_dates, max_dates)
```

### Arguments

`dtc`              The '--DTC' date to impute  
 A character date is expected in a format like `yyyy-mm-dd` or `yyyy-mm-ddThh:mm:ss`. Trailing components can be omitted and `-` is a valid "missing" value for any component.

`imputed_dtc`      The imputed DTC date

min\_dates

Minimum dates

A list of dates is expected. It is ensured that the imputed date is not before any of the specified dates, e.g., that the imputed adverse event start date is not before the first treatment date. Only dates which are in the range of possible dates of the dtc value are considered. The possible dates are defined by the missing parts of the dtc date (see example below). This ensures that the non-missing parts of the dtc date are not changed. A date or date-time object is expected. For example

```
impute_dtc_dtm(
 "2020-11",
 min_dates = list(
 ymd_hms("2020-12-06T12:12:12"),
 ymd_hms("2020-11-11T11:11:11")
),
 highest_imputation = "M"
)
```

returns "2020-11-11T11:11:11" because the possible dates for "2020-11" range from "2020-11-01T00:00:00" to "2020-11-30T23:59:59". Therefore "2020-12-06T12:12:12" is ignored. Returning "2020-12-06T12:12:12" would have changed the month although it is not missing (in the dtc date).

For date variables (not datetime) in the list the time is imputed to "00:00:00". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.

max\_dates

Maximum dates

A list of dates is expected. It is ensured that the imputed date is not after any of the specified dates, e.g., that the imputed date is not after the data cut off date. Only dates which are in the range of possible dates are considered. A date or date-time object is expected.

For date variables (not datetime) in the list the time is imputed to "23:59:59". Specifying date variables makes sense only if the date is imputed. If only time is imputed, date variables do not affect the result.

## Value

- The last of the minimum dates (min\_dates) which are in the range of the partial DTC date (dtc)
- The first of the maximum dates (max\_dates) which are in the range of the partial DTC date (dtc)
- imputed\_dtc if the partial DTC date (dtc) is not in range of any of the minimum or maximum dates.

signal\_duplicate\_records  
*Signal Duplicate Records*

---

**Description**

Signal Duplicate Records

**Usage**

```
signal_duplicate_records(
 dataset,
 by_vars,
 msg = paste("Dataset contains duplicate records with respect to",
 enumerate(vars2chr(by_vars))),
 cnd_type = "error"
)
```

**Arguments**

|          |                                                                                                                           |
|----------|---------------------------------------------------------------------------------------------------------------------------|
| dataset  | A data frame                                                                                                              |
| by_vars  | A list of variables created using <code>vars()</code> identifying groups of records in which to look for duplicates       |
| msg      | The condition message                                                                                                     |
| cnd_type | Type of condition to signal when detecting duplicate records. One of "message", "warning" or "error". Default is "error". |

**Value**

No return value, called for side effects

|                  |                                                                                       |
|------------------|---------------------------------------------------------------------------------------|
| slice_derivation | <i>Execute a Derivation with Different Arguments for Subsets of the Input Dataset</i> |
|------------------|---------------------------------------------------------------------------------------|

---

### Description

The input dataset is split into slices (subsets) and for each slice the derivation is called separately. Some or all arguments of the derivation may vary depending on the slice.

### Usage

```
slice_derivation(dataset, derivation, args = NULL, ...)
```

### Arguments

|            |                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dataset    | Input dataset                                                                                                                                                                                                                                                                                                                                                                                |
| derivation | Derivation                                                                                                                                                                                                                                                                                                                                                                                   |
| args       | Arguments of the derivation<br>A param() object is expected.                                                                                                                                                                                                                                                                                                                                 |
| ...        | A derivation_slice() object is expected<br>Each slice defines a subset of the input dataset and some of the parameters for the derivation. The derivation is called on the subset with the parameters specified by the args parameter and the args field of the derivation_slice() object. If a parameter is specified for both, the value in derivation_slice() overwrites the one in args. |

### Details

For each slice the derivation is called on the subset defined by the filter field of the derivation\_slice() object and with the parameters specified by the args parameter and the args field of the derivation\_slice() object. If a parameter is specified for both, the value in derivation\_slice() overwrites the one in args.

- Observations that match with more than one slice are only considered for the first matching slice.
- Observations with no match to any of the slices are included in the output dataset but the derivation is not called for them.

### Value

The input dataset with the variables derived by the derivation added

### Author(s)

Stefan Bundfuss

**See Also**

Higher Order Functions: [call\\_derivation\(\)](#), [derivation\\_slice\(\)](#), [print.derivation\\_slice\(\)](#), [restrict\\_derivation\(\)](#)

**Examples**

```
library(stringr)
advs <- tibble::tribble(
 ~USUBJID, ~VSDTC, ~VSTPT,
 "1", "2020-04-16", NA_character_,
 "1", "2020-04-16", "BEFORE TREATMENT"
)

For the second slice filter is set to TRUE. Thus derive_vars_dtm is called
with time_imputation = "last" for all observations which do not match for the
first slice.
slice_derivation(
 advs,
 derivation = derive_vars_dtm,
 args = params(
 dtc = VSDTC,
 new_vars_prefix = "A"
),
 derivation_slice(
 filter = str_detect(VSTPT, "PRE|BEFORE"),
 args = params(time_imputation = "first")
),
 derivation_slice(
 filter = TRUE,
 args = params(time_imputation = "last")
)
)
```

*Create a tte\_source Object*

---

**Description**

The tte\_source object is used to define events and possible censorings.

**Usage**

```
tte_source(dataset_name, filter = NULL, date, censor = 0, set_values_to = NULL)
```

**Arguments**

|               |                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dataset_name  | The name of the source dataset<br>The name refers to the dataset provided by the source_datasets parameter of derive_param_tte().                                                                                                        |
| filter        | An unquoted condition for selecting the observations from dataset which are events or possible censoring time points.                                                                                                                    |
| date          | A variable providing the date of the event or censoring. A date, or a datetime can be specified. An unquoted symbol is expected.<br>Refer to derive_vars_dt() to impute and derive a date from a date character vector to a date object. |
| censor        | Censoring value<br>CDISC strongly recommends using 0 for events and positive integers for censoring.                                                                                                                                     |
| set_values_to | A named list returned by vars() defining the variables to be set for the event or censoring, e.g. vars(EVENTDESC = "DEATH", SRCDOM = "ADSL", SRCVAR = "DTHDT"). The values must be a symbol, a character string, a numeric value, or NA. |

**Value**

An object of class tte\_source

**Author(s)**

Stefan Bundfuss

---

use\_ad\_template

*Open an ADaM Template Script*

---

**Description**

Open an ADaM Template Script

**Usage**

```
use_ad_template(
 adam_name = "adsl",
 save_path = paste0("./", adam_name, ".R"),
 package = "admiral",
 overwrite = FALSE,
 open = interactive()
)
```

**Arguments**

|           |                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| adam_name | An ADaM dataset name. You can use any of the available dataset name ADAE, ADCM, ADEG, ADEX, ADLB, ADMH, ADPP, ADSL, ADVS, and the dataset name is case-insensitive. The default dataset name is ADSL. |
| save_path | Path to save the script.                                                                                                                                                                              |
| package   | The R package in which to look for templates. By default "admiral".                                                                                                                                   |
| overwrite | Whether to overwrite an existing file named save_path.                                                                                                                                                |
| open      | Whether to open the script right away.                                                                                                                                                                |

**Details**

Running without any arguments such as `use_ad_template()` auto-generates `adsl.R` in the current path. Use `list_all_templates()` to discover which templates are available.

**Value**

No return values, called for side effects

**Author(s)**

Shimeng Huang, Thomas Neitmann

**See Also**
